

# WASTE MANAGEMENT MASTER PLAN

# **CITY OF PETERBOROUGH**

Cambium Reference No.: 1965-001

November 12, 2012

Cambium Environmental Inc.

P.O. Box 325, 52 Hunter Street East, Peterborough, Ontario, K9H 1G5 Telephone: (705) 742.7900 (866) 217.7900 Facsimile: (705) 742.7907 www.cambium-env.com

NOTE:

The practice of this Company in issuing reports of this nature is to require the recipient not to publish the report or any part thereof without the written consent of Cambium Environmental Inc.

### **QUALIFICATIONS AND LIMITATIONS**

#### Limited Warranty

In performing work on behalf of a client, Cambium Environmental relies on its client to provide instructions on the scope of its retainer and, on that basis, Cambium Environmental determines the precise nature of the work to be performed. Cambium Environmental undertakes all work in accordance with applicable accepted industry practices and standards. Unless required under local laws, other than as expressly stated herein, no other warranties or conditions, either expressed or implied, are made regarding the services, work or reports provided.

#### Reliance on Materials and Information

The findings and results presented in reports prepared by Cambium Environmental are based on the materials and information provided by the client to Cambium Environmental and on the facts, conditions and circumstances encountered by Cambium Environmental during the performance of the work requested by the client. In formulating its findings and results into a report, Cambium Environmental assumes that the information and materials provided by the client or obtained by Cambium Environmental from the client or otherwise are factual, accurate and represent a true depiction of the circumstances that exist. Cambium Environmental relies on its client to inform Cambium Environmental if there are changes to any such information and materials. Cambium Environmental does not review, analyze or attempt to verify the accuracy or completeness of the information or materials provided, or circumstances encountered, other than in accordance with applicable accepted industry practice. Cambium Environmental will not be responsible for matters arising from incomplete, incorrect or misleading information or formation or formation or that are concealed from Cambium Environmental during the provision of services, work or reports.

Facts, conditions, information and circumstances may vary with time and locations and Cambium Environmental's work is based on a review of such matters as they existed at the particular time and location indicated in its reports. No assurance is made by Cambium Environmental that the facts, conditions, information, circumstances or any underlying assumptions made by Cambium Environmental in connection with the work performed will not change after the work is completed and a report is submitted. If any such changes occur or additional information is obtained, Cambium Environmental should be advised and requested to consider if the changes or additional information affect its findings or results.

When preparing reports, Cambium Environmental considers applicable legislation, regulations, governmental guidelines and policies to the extent they are within its knowledge, but Cambium Environmental is not qualified to advise with respect to legal matters. The presentation of information regarding applicable legislation, regulations, governmental guidelines and policies is for information only and is not intended to and should not be interpreted as constituting a legal opinion concerning the work completed or conditions outlined in a report. All legal matters should be reviewed and considered by an appropriately qualified legal practitioner.

#### Site Assessments

A site assessment is created using data and information collected during the investigation of a site and based on conditions encountered at the time and particular locations at which fieldwork is conducted. The information, sample results and data collected represent the conditions only at the specific times at which and at those specific locations from which the information, samples and data were obtained and the information, sample results and data may vary at other locations and times. To the extent that Cambium Environmental's work or report considers any locations or times other than those from which information, sample results and data was specifically received, the work or report is based on a reasonable extrapolation from such information, sample results and data but the actual conditions encountered may vary from those extrapolations.

Only conditions at the site and locations chosen for study by the client are evaluated; no adjacent or other properties are evaluated unless specifically requested by the client. Any physical or other aspects of the site chosen for study by the client, or any other matter not specifically addressed in a report prepared by Cambium Environmental, are beyond the scope of the work performed by Cambium Environmental and such matters have not been investigated or addressed.

#### No Reliance

Cambium Environmental's services, work and reports are provided solely for the exclusive use of the client which has retained the services of Cambium Environmental and to which its reports are addressed. Cambium Environmental is not responsible for the use of its work or reports by any other party, or for the reliance on, or for any decision which is made by any party using the services or work performed by or a report prepared by Cambium Environmental without Cambium Environmental's express written consent. Any party that relies on services or work performed by Cambium Environmental or a report prepared by Cambium Environmental without Cambium Environmental's express written consent, does so at its own risk. No report of Cambium Environmental may be disclosed or referred to in any public document without Cambium Environmental's express prior written consent. Cambium Environmental specifically disclaims any liability or responsibility to any such party for any loss, damage, expense, fine, penalty or other such thing which may arise or result from the use of any information, recommendation or other matter arising from the services, work or reports provided by Cambium Environmental.

#### Limitation of Liability

Cambium Environmental is not responsible for any lost revenues, lost profits, cost of capital, or any special, indirect, consequential or punitive damages suffered by the client or any other party in reliance on any Cambium Environmental work or report. Cambium Environmental's total liability and responsibility to the client or any other person for any and all losses, costs, expenses, damages, claims, causes of action or other liability whatsoever which do or may result or arise from or be in relation to Cambium Environmental's services, work (or failure to perform services or work) or reports shall be limited to the invoiced charges for the work performed by Cambium Environmental.

### **EXECUTIVE SUMMARY**

The City of Peterborough, like all Ontario municipalities, is responsible for the collection, processing and disposal of the residential wastes generated within its boundaries. It has performed this service effectively over the years, expanding its mandate from 100% disposal prior to the late-1980's, to that of providing diverse municipal programming which encourages its residents to divert as much waste from landfill as possible. Peterborough has enjoyed an excellent reputation amongst its municipal waste management peers for the past 20 years, showing initiative and progressive thinking in waste diversion initiatives, the result of which has been a residential diversion rate of 50% and greater over the past ten years.

Peterborough's last Waste Management Master Plan (WMMP) was completed in 1993. It was a joint Plan for both the City and the County, which provided a 25-year planning tool for the Region. Many of the systems and recommendations from that WMMP have been successfully incorporated over the past 20 years. The diversion programs implemented over those years have matured to the point where little further increases in diversion rates are being realized today. Now was felt to be the right time for a new WMMP. Many new opportunities and technologies in the waste management field have emerged during the intervening decades. This WMMP considers these opportunities and identifies where the City could feasibly incorporate them into its programs to achieve substantially greater diversion from landfill.

This WMMP looks primarily at diversion of solid waste from residential sources, as this is the area the City has the most direct control over. However, the Industrial, Commercial and Institutional sectors are highlighted as areas of great potential which cannot and should not be ignored. Options for disposal/processing of the wastes still remaining after diversion are briefly outlined; however, it is not within the scope of this WMMP to make recommendations on disposal.

With an eye to the stated goals of increasing diversion, minimizing waste generation, and remaining fiscally responsible, this WMMP contains a number of key recommendations for the City's Waste Management Division to consider as it charts its course for the next 20 years.

Ambitious targets have been set so that our dependence upon landfilling or other means of disposal may be minimized. Given the changeable nature of the waste industry and the broad expanse of time it incorporates, the Plan should be viewed as a living document and reviewed regularly to ensure its continued relevancy to the municipality's social, environmental, legislative and financial state dictates.

# **1.0 INTRODUCTION**

Cambium Environmental Inc. (Cambium) has been retained by the Corporation of the City of Peterborough (City) to prepare a municipal solid Waste Management Master Plan (WMMP). This WMMP will be a tool which the City will use to develop the waste management policies, guidelines, and general best practices for both short and long term planning.

In 1989, the County of Peterborough (County) and City established a plan for waste diversion and reduction with an initial target of 40% and the hope of improved capture rates and participation as the programs continued to grow and improve. This target was soon met and surpassed.

In December 1993, a waste management master plan was completed for the City and the County. The plan, titled Peterborough County/City Waste Management Master Plan, Waste Management System Plan Report (Proctor & Redfern, December 1993) provided a joint County/City plan over a 25-year planning period. The final preferred system included components to assist the City and County in achieving a goal of diverting 50% of all waste generated from landfill disposal by the year 2000. Though the 25 year period is not yet up, it was felt that the City and County both should take a fresh look at their respective waste management systems, in light of new options and opportunities for diversion.

Under the Municipal Act, 2001, the City has the responsibility to plan for and manage municipally-generated solid waste within its boundaries. The focus of the WMMP will be to provide strategic direction for optimizing the current and future residential solid waste diversion programs to best meet the sustainability needs (i.e. social, economic, and environmental) of the City over the next 20 years.

### 1.1 BACKGROUND

Over the past 20 years, the City has successfully established a number of programs which have led to impressive diversion rates, and an excellent reputation amongst municipal peers. Now that many of these programs have matured, there is a need to investigate new and emerging technologies and opportunities such that the City's diversion rates can continue to climb.

For the preparation of this report, only 2010 data was collected and referenced which was complete and readily available when Cambium required the information necessary to undertake the review of the current waste management system. The use of the 2010 allowed for consistency throughout the report.

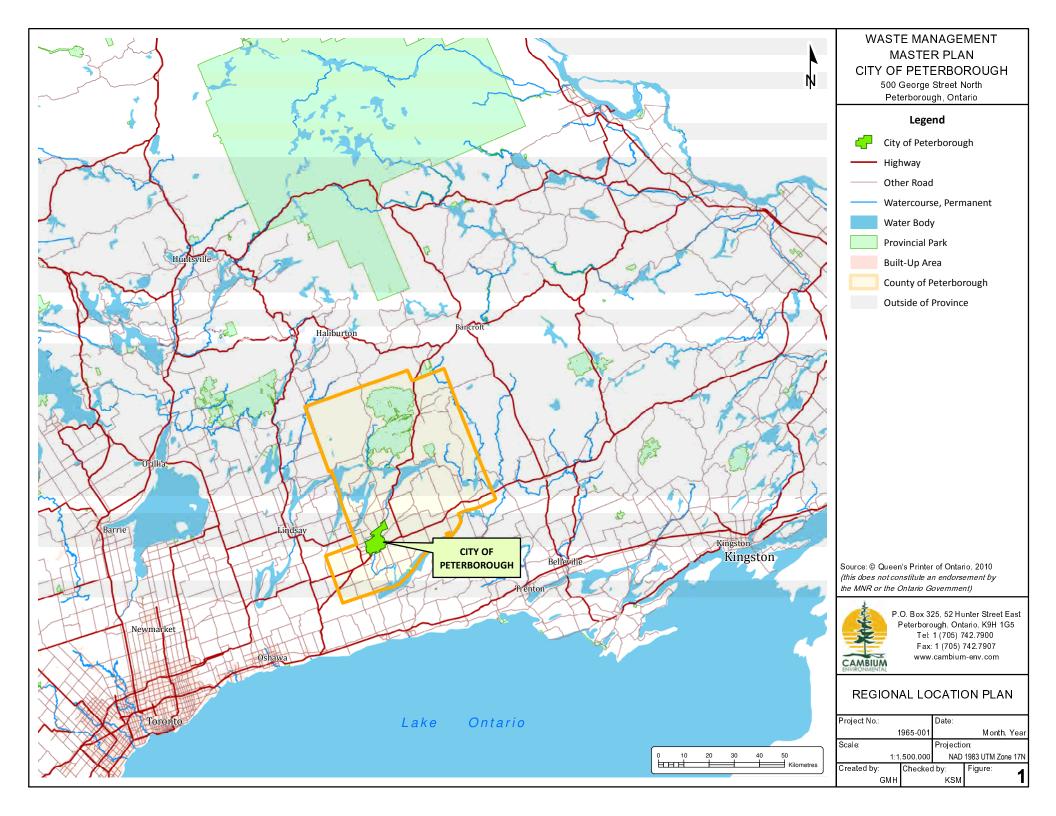

In 2010, the City of Peterborough reported a population of approximately 79,334 persons (26,240 single-family households and 8,675 multi-family households). It should be noted that the City of Peterborough does not include the County but the waste management services are shared in part with the County; therefore, the City will need to

consider the County during the planning process. The City covers an area of approximately 1,283 square kilometres and is located just over one hour northeast of Toronto in the Kawartha Lakes Region (Figure 1).

The City manages the collection of residential and small Industrial, Commercial, and Institutional (IC&I) garbage. The garbage is hauled to the Peterborough County/City Waste Management Facility (PCCWMF) on Bensfort Road for disposal. In June 2002, the PCCWMF became the joint property of the County and City. The PCCWMF encompasses 158 hectares and is located on Bensfort Road approximately six km south of the City on part Lot 13, 14, and 15, Concession 14, within the Township of Otonabee South Monaghan.

The City is also responsible for the curbside collection of recyclable materials, which it does through a contracted weekly collection. Recyclables are collected on the same day as garbage and taken to the City's Materials Recycling Facility at 390 Pido Road for processing. The County also uses this facility for processing its recyclables.

### 1.2 PLANNING AND CONSULTATION PROCESS OVERVIEW

The planning process used to develop this long term WMMP was consistent with the Ontario Ministry of Environment (MOE) Policy Statement on Waste Management Planning.

The Provincial Policy Statement on waste management planning sets out the following principles to be considered in any waste management planning process:

- Environmental protection is a shared responsibility.
- Integrated waste management systems that reflect local circumstances are in place.
- Diversion of materials from final disposal is maximized in consideration of the provincial 60% diversion target, including the creation of incentives where appropriate.
- Public and private sectors cooperate, where possible, to realize cost savings and maximize efficiencies.
- Waste management choices consider economic, social, and environmental costs.
- Investment in infrastructure is made to accommodate growth.
- Waste is managed as close to the source of generation as possible.
- Producer responsibility is incorporated into waste reduction and management.
- Decision-making is open and transparent.
- Informed citizens support waste management choices and participate in waste management programs.
- Maximum value from waste is recovered from the waste stream.
- Innovative waste management technologies and approaches are incorporated as appropriate to local circumstances to achieve sustainable solutions.

The steps followed in developing this WMMP included:

- 1) Understanding and assessing the current waste management system;
- 2) Developing a vision and goals for future waste management initiatives;
- 3) Understanding and assessing the options available to the City;
- 4) Selecting waste management system components; and,
- 5) Preparing the final plan document.

The community consultation included discussions with local stakeholders for the early identification of key issues and open houses to present the study results and recommended waste management system options. An outline

of the public consultation process, as well as the results of the consultation activities are provided in Appendix A. Input from the public has been incorporated throughout this report.

In July 2011, the Director of Utility Services requested that a Steering Committee (SC) be established to review and update the City's Waste Management Master Plan. The SC, comprised of three City employees and one County representative including one City Councillor, provided strategic direction and made recommendations on the acceptance of a new plan to City Council.

### 1.3 ROLES AND RESPONSIBILITIES

Outlined in the Policy Statement on Waste Management Planning, each waste generating sector has roles and responsibilities in the management of solid waste. Each sector must actively participate in trying to achieve a more sustainable waste management system, while being environmentally responsible.

The following roles and responsibilities have been developed by the MOE as a guide for communities trying to attain a sustainable solid waste management community.

#### The Province

- Set and enforce environmental standards and requirements for waste diversion and disposal.
- Support municipalities and the private sector by providing the necessary tools for waste diversion and the disposal of waste.
- Issue approvals to waste disposal sites and waste haulers to ensure appropriate management.

#### **Municipalities**

- Plan for and provide direct waste management services to their residents, and in some cases, local businesses, including programs for waste diversion and disposal of waste.
- Plan for, site, and invest in necessary waste management infrastructure.
- Comply with provincial waste management standards and requirements.
- Fund and implement diversion programs under the Waste Diversion Act.

#### Private Sector Waste Management Industry

- Provide waste services to clients of the IC&I sectors, and in some cases, through contract to municipalities, waste services to residents.
- Comply with provincial waste management standards and requirements.

#### The IC&I Sectors

- Plan for, and help reduce, the amount of waste generated by their operations.
- Comply with provincial waste management standards and requirements.

#### Producers and Stewards

- Minimize the life-cycle impacts (i.e. environmental footprint) of products and their packaging through Design for the Environment.
- Fund and implement diversion programs under the Waste Diversion Act.

#### The Public

- Help reduce the amount of waste generated through their activities and choices.
- Engage in waste management decisions and participate in waste prevention and diversion programs.

#### **Environmental Groups**

- Promote the need to reduce waste and conserve our natural resources.
- Raise public awareness of waste management issues.

Under the Ministry of the Environment's Policy Statement on Waste Management Planning, municipalities are responsible for:

- Planning, siting and investing in waste management infrastructure
- Funding and implementing diversion programs under the Waste Diversion Act

### 1.4 GOALS AND OBJECTIVES OF THE PLAN

The City of Peterborough has developed a Guiding Principle that needs to be central to the establishment of the Goals and Objectives and any deliverables that are established subsequent to the Plan. The **Guiding Principle** is provided below:

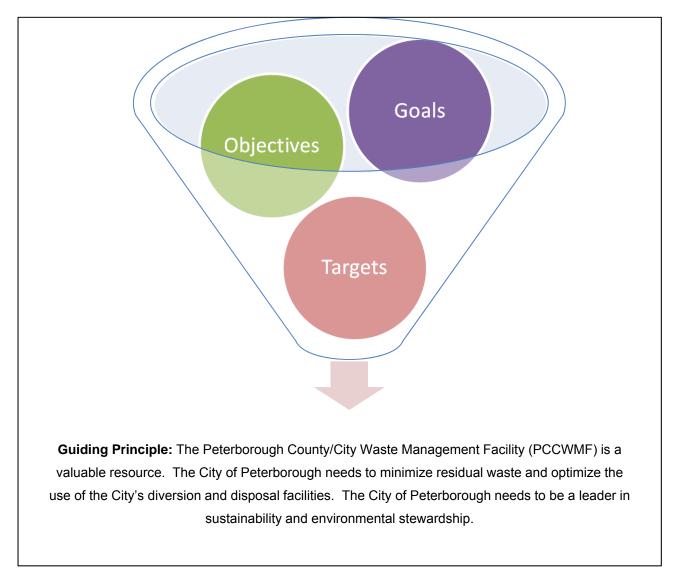

Chart 1: Guiding Principle

### Goals

The long-term WMMP is an essential step towards the provision of sustainable waste systems within the City of Peterborough. The WMMP began with the establishment of fundamental goals that are attainable and within the means of the residents to complete. The goals always relate back to the Guiding Principle and will help the City be a leader in sustainability and environmental stewardship. The fundamental goals of the WMMP are as follows:

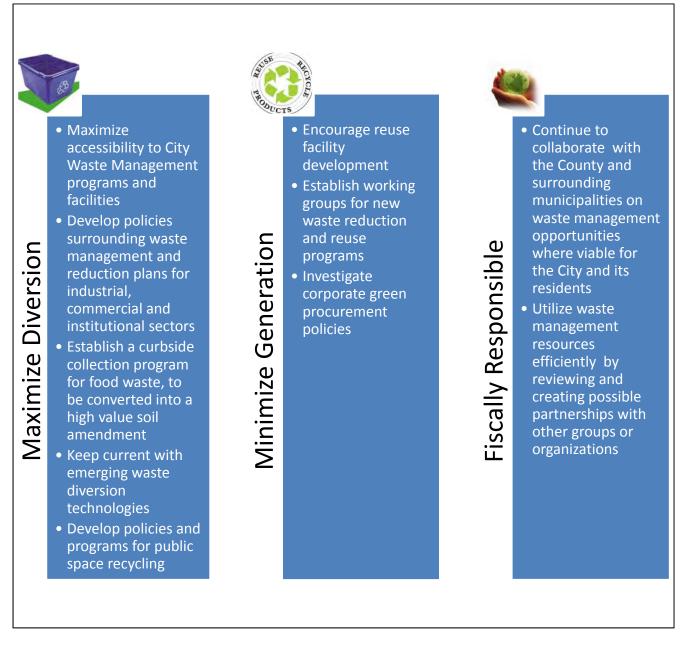

Chart 2: Goals

Waste Management Master Plan City of Peterborough Ref. No.: 1965-001 November 12, 2012

### Objectives

The fundamental goals are obtained by setting more specific achievable objectives. Through approval of Report USWM11-004 on October 17, 2011, the City has established key objectives for each of the three goals. The objectives are as follows:

#### Chart 3: Objectives

### Targets

Key targets have been generated from the goals and objectives that apply to all. These targets will allow the City to monitor their progress with the established Plan and verify deliverables. The targets will be adjustable with the changing economic and social trends and are provided as follows:

### **KEY TARGETS**

- Expand the number and type of education and outreach and/or partnership activities year over year from 2010 levels.
- Meet all eight Waste Management Best Practices as outlined in the Blue Box Program Enhancement and Best Practices Assessment Project Report, 2007, prepared by KPMG LLP, a Canadian advisory services firm.
- Residential diversion rate will increase from 2010 level of 50% to 75% over 20 years, with a review of target every five years.
- Capture rates for blue box materials will increase 10% from 2006 levels (79.5%) over 20 years, with a review of target every five years.
- Participation rate of 50% in year 1 of the proposed SSO program with an increase for each year of the program.

As previously noted in the Key Targets, the fundamental Waste Management Best Practices (KPMG, 2007) include:

- 1. Development and implementation of an up-to-date plan for recycling, as part of an integrated waste management system;
- 2. Multi-municipal planning approach to collection and processing recyclables;
- 3. Establishing defined performance measures, including diversion targets, monitoring, and a continuous improvement program;
- 4. Optimization of operations in collections and processing;
- 5. Training of key program staff in core competencies;
- 6. Following generally accepted principles for effective procurement and contract management;
- 7. Appropriately planned, designed, and funded promotion and education program; and
- 8. Established and enforced policies that induce waste diversion.

Many of these best practices are already in place with the City. The development of this report will aid in formalizing the plans and approaches necessary to implement the best practices and seeing the programs through to completion.

### 1.5 PROBLEMS/OPPORTUNITIES

Since the 1993 Waste Management Master Plan (Proctor & Redfern, December 1993), the City has looked to pursue a more efficient solid waste management system.

There are several main issues facing the City waste management system including:

- Diminishing life capacity of the PCCWMP;
- Diminishing or uncertain life capacity of Materials Recycling Facility (MRF);
- Limited Monitoring and Reporting program in place to verify current capture and participation rates;
- No Source Separated Organics (SSO) program; and,
- Limited influence/role with IC&I waste sector and waste management.

# 2.0 RELEVANT LEGISLATION

There is federal, provincial, and municipal legislation that guides the waste management practices for every municipality and/or private sector operation. The key federal and provincial legislation, as it relates to waste management, is summarized below and is included in detail in Appendix B. The municipal by-laws are referenced in Sections 3.1 and 5.3.

### 2.1 FEDERAL LEGISLATION

Waste management is governed federally through the Canadian Environmental Protection Act (CEPA) and the Canadian Environmental Assessment Act (CEAA). The CEPA provides the legislative framework for the establishment of pollution prevention plans, identification of toxic substances, establishment of waste management facilities, import and export of waste, as well as to regulate the effects of government operations on and in relation to federal lands and aboriginal lands. The CEPA established the Environmental Registry as a means for the Canadian public to receive information on any waste management facility or system to be established or altered which requires public input and screening.

The Canadian Environmental Assessment Act (CEAA) applies to all projects where the Government of Canada has decision-making authority – whether as a proponent, land manager, source of funding, or regulator. All projects receive an appropriate degree of environmental assessment which ensures that the environmental effects of projects are carefully reviewed before federal authorities take action in connection with them so that projects do not cause significant adverse environmental effects.

Additional information on either the CEPA or the CEAA is included in Appendix B.

### 2.2 PROVINCIAL LEGISLATION

Waste management is regulated by the Province under the Environmental Protection Act (EPA) and the Ontario Environmental Assessment Act (EAA). The EPA provides the legislative framework for the establishment of waste management facilities. The establishment, management, alteration, and/or expansion of waste management facilities in the Province of Ontario requires an Environmental Compliance Approval (ECA; formerly referred to as a Provisional Certificate of Approval) under Part 5, Section 27 of the EPA. Key provincial legislation includes:

- Ontario Regulation (O. Reg.) 347 General Waste Management;
- O. Reg. 101/94 Waste Diversion Act;
- O. Reg. 101/07 Waste Management Projects, under the EAA and amendments to the EPA for waste recycling, mining, alternative fuels, as well as new/emerging technologies;

- O. Reg. 103/94 Industrial, Commercial and Institutional Source Separation Programs; and,
- O. Reg. 267/03 Nutrient Management Act, regulating nutrients and use on agricultural land.

In addition, the MOE posts Guidelines that are used in a similar way to regulations when preparing ECA documents.

Additional information on the provincial legislation and guidelines for waste management are provided in Appendix B for reference purposes.

## 3.0 REVIEW OF CURRENT WASTE MANAGEMENT SYSTEM

### 3.1 SYSTEM OVERVIEW

The City provides curbside garbage (weekly), blue box (weekly), leaf and yard waste (35 weekly collections annually), and bulky goods (twice per year) collection services to 26,240 single-family homes and 8,675 multi-family households. Details of these services, as well as other diversion opportunities provided by the City, are listed below.

The City enacted a by-law in February 1993 that enforces a two bag/container limit for residences, and a four bag/container limit for businesses and lodging houses. The by-law (Chapter 594 Garbage Collection) also defines recyclable material and stipulates that it is illegal to dispose of recyclables as solid waste. In addition, the City developed a by-law (By-Law 09-108) that details all materials that are banned from the PCCWMF. A copy of these by-laws are included in Appendix B for reference purposes. It is recommended that the City review and consider updating these by-laws to reflect the current waste management planning goals and objectives within the next one to two years.

A total of 34,683 tonnes of residential waste was generated within the City in 2010 (City of Peterborough, 2011). Approximately 51.0% (17,823 tonnes) was diverted through programs such as blue box recycling, leaf and yard waste composting, MHSW collections, WEEE, and backyard composting. These programs and the remaining waste stream are discussed in more detail below.

The waste composition for the City in 2010 is included as Table 1.

Table 1 City of Peterl	oorough Waste Composition (2010)
------------------------	----------------------------------

Material	Weight (tonnes)	Percentage of Waste Stream
Diverted		
Blue Box Recyclables (marketed only)	7,977	23.0%
Organics and Leaf and Yard Waste	7,011	20.2%
Other Recyclables (i.e. scrap metal, tires, etc.)	1,590	4.6%

Notes: 1. Source: (City of Peterborough, 2011).

2. All diverted material weights listed above represent tonnes marketed, not collected.3.Weights noted above are rounded.

A graphical representation of the City's waste composition is included in Chart 4.

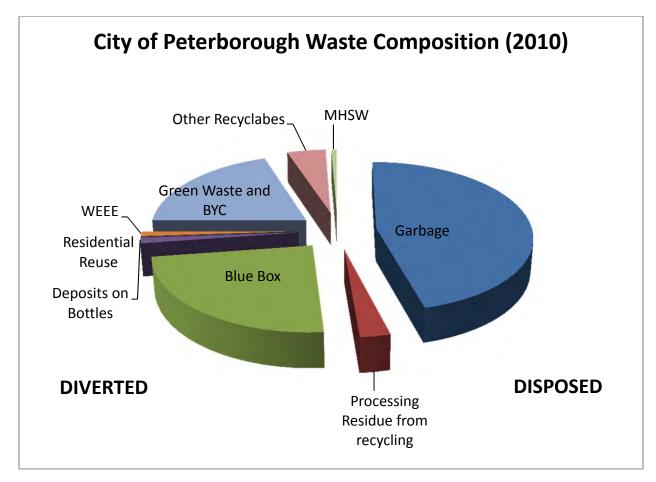

Chart 4: City of Peterborough Waste Composition (2010)

With the 2010 population of 79,334 persons, disposal quantities within the City averaged 218.3 kg per person per year and diversion quantities averaged 225 kg per person per year (City of Peterborough, 2011).

# 3.2 WASTE MANAGEMENT SYSTEM COSTS

Overall, the City's waste management system services in 2010 had a net operating cost of \$2,869,232. The costs include all programs financed under the Waste Management Division, including solid waste collection and disposal, blue box collection and processing, green waste collection and composting, the Municipal Hazardous or Special Waste (MHSW) depot, promotion and education, salaries, and all other administrative expenses. The net cost to provide all waste management services to City residents in 2010 was \$82.18 per household. The cost per household is based on a simple calculation and is not based in any way on the average assessment.

### 3.2.1 DIVERSION PROGRAM COSTS

City diversion programs – including blue box recycling, green waste collection, compost production and distribution, and the household hazardous waste and electronics depot – had a net operating cost of \$1,198,352.50 in 2010. This includes all staff and administration expenses for each program, as well as all forms of recoveries, including sale of recyclables to markets and provincial funding. It does not include recoveries or expenses for recyclables handled at the landfill site. The net cost to provide these diversion programs to City residents in 2010 was \$34.32 per household.

### 3.2.2 GARBAGE COLLECTION AND DISPOSAL COSTS

Garbage collection and disposal costs consider the weekly curbside collection of garbage from households and small businesses, the bi-annual collection of large articles, and the handling and disposal of these items at the PCCWMF. The City shares the costs and revenues for the PCCWMF with the County of Peterborough.

The total tonnage of waste received at the PCCWMF in 2010 was 60,248 from the City and County combined., and the gross cost to operate the facility was \$3,101,900.15. This included all aspects of running the facility, including revenue-sharing with the County, consultant fees, salaries, contracted services, taxes, host royalties and much more. When recoveries are factored in, including rental property incomes, tip fees, revenue from sale of marketable materials and provincial funding for tire recycling, the City showed a net revenue of \$580,686.00 at this facility in 2010. This does not take into account the annual payments of close to one million dollars into reserve funds to help finance potential future overruns and post-closure costs.

Collection costs for garbage and large articles totalled \$1,130,150.00, bringing the net operating cost to handle garbage in the City to \$549,464.00. When annual reserve fund costs are factored in, it brings the net cost to provide disposal programs to City residents in 2010 to \$44.38 per household or 29% more than diversion program costs.

It should also be noted that disposal costs consider only the actual dollars paid out in a given year, and do not take into account other costs that are more difficult to quantify (long-term post-closure costs, search and development of new disposal options, environmental and societal costs, etc.).

A true-cost analysis of the City and County's disposal practices is highly recommended, so that valid comparisons can be made by decision-makers between future disposal and diversion options.

### 3.2.3 PROMOTION AND EDUCATION COSTS

As noted in the Blue Box Program Enhancement and Best Practices Report (KPMG, 2007), those communities in the 2005 WDO Datacall with recovery rates at or exceeding 60% were generally spending between \$0.83 to \$1.18 per household on the promotion of recycling. It was also suggested that there was a strong correlation between increased promotion and education (P&E) spending and increased recovery in Ontario recycling programs. In 2010, the City spent a total of \$32,500.00, or \$0.93 per household, on all waste management-related promotions. Of that, recycling/blue box-specific P&E expenses were \$13,290.00 in 2010, or \$0.38 per household, well under half of what Best Practices recommend.

### 3.3 CITY/COUNTY PARTNERSHIPS

An important aspect of solid waste management system planning for the City is the ongoing shared commitment between the City and County, specifically the shared responsibility of the PCCWMF and mutual use of the MRF. The City, in partnership with the County, owns and operates the PCCWMF which is located within the Township of Otonabee-South Monaghan. The City intends to move forward in partnership with the County to determine the most suitable option for waste disposal for both jurisdictions when capacity is no longer available at the PCCWMF.

The City and County have separate long term agreements with HGC Management Inc., the operator of the MRF, from January 17, 2008 for a period of seven years. The Pido Road MRF was constructed by the City in 1989. The City also owns and operates the Harper Road compost facility which is currently utilized to compost leaf and yard waste and the SSO pilot program materials from the City and the County. The MRF, if operated properly, could have a remaining life capacity of seven to ten years. There is also a chance that Stewardship Ontario may decide that the current operation is not sufficient for the service area and receiving stream within the next few years, and may require the City to look at alternatives.

A review of this relationship should be undertaken to ensure absolute clarity in agreements on the future direction of waste disposal requirements, policies and operations. The City and County need to work together to find a compatible and sustainable solution for both parties.

### 3.4 WASTE AUDIT/MONITORING

The City has performed a number of waste audits over the years. The data obtained through these audits is essential to assess waste composition; to determine the recovery performance of existing programs (capture rates); and, to assess opportunities and priorities for recovery improvement.

The last waste audits done in the City were completed in 2006, in partnership with Stewardship Ontario. There were four separate audits conducted over the year, one during each season. One hundred households were selected to participate, and these same households were audited each time. Audit results indicated that the

participation rate in the garbage curbside collection program is virtually 100% with an average of 1.36 bags per week per household being set out. The participation rate in the blue box program was determined to be 99%. The average capture rate of blue box materials was found to be 79.5%. This is less than the blue box capture rate target of 85% for a municipality in the Medium Urban municipal grouping, as determined by the Continuous Improvement Fund (CIF) (Trow, 2010). It is anticipated that the capture rate may have increased to date, but there have been no additional audits to verify this information.

An identical set of audits is planned for the City during 2012, which will show whether capture rates have improved over the intervening years.

### 3.5 WASTE STREAMS

The following section provides a breakdown of the waste streams currently processed within the City. There are two main areas of waste: the diverted waste; and the waste that is not diverted which for the purposes of this report has been referred to as disposed waste.

### 3.5.1 DIVERSION

The material currently diverted by the City is discussed in further detail in this section to provide a better understanding of the level of effort already achieved by the City and residents to keep materials out of the landfill.

#### 3.5.1.1 RESIDENTIAL BLUE BOX

The residential blue box made its start in the 1970s with a group called the "Peterborough Environment People", or "PEP". The City paid rent for a Quonset hut at the west end of Hawley Street, which served as a depot for recyclables. This was open from 8 am to 12 pm on Saturdays for drop off of residents' glass and metal containers and newspapers.

At about the same time, Scott's Plains Recycling Inc. had tried to develop a business making shipping pallets, which employed federal prisoners on parole and living in a local half-way house. The project was not successful so the directors of the Scott's Plains Recycling Inc. made a proposal to the City to start a curbside collection coinciding with garbage pick-up and using the blue box. Premises were rented in an old factory building on Perry Street. It soon became obvious that the Perry Street location was too small and a facility built specifically for material recovery was required. Construction started in 1988 on the Pido Road facility. The weekly collection of recyclables by blue box began in 1987.

In February of 1993, participation in the blue box program was encouraged by including a definition of "recyclable" items in the City's Garbage by-law, and making it illegal to dispose of recyclable items in the regular garbage. Definitions of allowable receptacles for recyclables, as well as garbage and green waste, were also included in the by-law. A copy of this By-Law can be found in Appendix B.

In January of 2008, the City moved from a five-stream system of recyclables collection, to a two-stream system. This was done to make collections at the curb faster, more efficient, and convenient for residents. A "Fiber" stream and a "Containers" stream are sorted and processed on two separate lines at the MRF. In 2010, the City of Peterborough recycled 8,460 tonnes of blue box material, for a blue box diversion rate of approximately 24%. An additional 437 tonnes are calculated to be diverted through the LCBO Deposit Return Program.

All residential blue box material collected is taken to the MRF located on Pido Road. Recyclable materials can also be dropped off at no charge at a 24 hour depot, located at the MRF.

### 3.5.1.2 ORGANIC WASTE

Organic – or biodegradable - waste has both general and specific types. The terms that are generally referenced in this Plan are as follows:

**SSO** – Food waste and non-recyclable paper that is separated for composting or other organic waste processing. Some municipalities have widened the definition of SSO to include diapers, sanitary products and pet waste. Typically has greater processing requirement than leaf and yard waste, therefore it is identified as a separate component of organic waste.

**Leaf and Yard Waste** - Refers to leaves, grass, weeds, trimmings, brush, and woody materials (twigs, branches, etc.).

**Backyard Compost** - Composting of residential organic materials by a household, usually in the backyard. Typically includes only fruits, vegetables and other non-meat and non-dairy products from the kitchen. Generally considered a method of source reduction as it is done at the home.

Please refer to the Glossary of Terms and Abbreviations at the end of this document for further clarification, if required. A total of 7,027 tonnes of organic materials were diverted through a combination of the methods described below. This represents 20.3% of the total residential waste stream.

#### 3.5.1.2.1 LEAF AND YARD WASTE DIVERSION

Leaf and yard waste material is transported to the composting facility on Harper Road for processing. An open windrow composting process is used. In 2010, a total of 4,941 tonnes of leaf and yard waste material was collected within the City, which represents approximately 14.2% of the total residential waste stream by weight. Of this, approximately 86% was collected by the City through the curbside program and the remaining 14% was dropped off by residents at the depot at the PCCWMF.

### 3.5.1.2.2 SOURCE SEPARATED ORGANICS DIVERSION

A total of 625 single-family households and three (3) restaurants are included in the City's SSO pilot program. 204.75 tonnes of SSO were collected by the City in 2010, which represents 7.1% of the total residential waste stream by weight. The City has noted that the majority of households in the pilot neighbourhood do not participate in this program, which began in 2001 and has lost some momentum over the years due to resident turnover and lack of promotion. SSO materials collected through this pilot program are transported to the composting facility on Harper Road where they are processed along with the leaf and yard waste. When completely composted, the material is screened, analysed, and made available to City and County residents through truckload deliveries or self-load options at Peterborough Green-Up and the PCCWMF.

### 3.5.1.2.3 BACKYARD COMPOSTER DIVERSION

Approximately 1882 tonnes of residential organics were assumed to be diverted through backyard composting and other at-home reduction efforts in 2010 (including an estimated 368 tonnes which were 'grasscycled'). This is based on the assumption that each composter diverts an estimated 100 kg/unit/year. The City had distributed 15,135 units at the end of 2010.

#### 3.5.1.3 MUNICIPAL HAZARDOUS WASTE

The year-round MHSW Depot is located at 400 Pido Road in Peterborough and is open to all City and County residents, free of charge. Materials such as paint, batteries, used oil, solvents, fertilizers, pesticides, old pharmaceuticals, used syringes, propane tanks, fluorescent lights, and antifreeze are accepted at this facility from households and small businesses. It is open four days a week, from 8 am until 4 pm.

A total of 229 tonnes of MHSW material was collected in 2010. Of the 229 tonnes collected, 150.28 tonnes were disposed and 79.15 tonnes were recycled and reused, representing approximately 0.2% by weight of the entire residential waste stream.

#### 3.5.1.4 WASTE ELECTRONIC AND ELECTRICAL EQUIPMENT

The following municipal depots within the City provide waste electronic and electrical equipment (WEEE) collection services and are registered collection locations with Ontario Electronics Stewardship (OES):

- MRF(400 Pido Road, Peterborough)
- PCCWMF (Bensfort Road, Otonabee South Monaghan)

Special single event days for the collection of WEEE materials are also held periodically by the City at select locations. A number of commercial retailers also provide WEEE drop off depots through the Ontario Electronics Stewardship Program for residents, if needed.

A total of 333 tonnes of WEEE material was diverted by the City in 2010, which represents approximately 1.0% by weight of the entire residential waste stream.

### 3.5.1.5 OTHER DIVERSION

In addition to the above noted diversion streams, the PCCWMF and MRF provided collection of various recyclable materials:

- Used Tires 17.5 tonnes of tire material were diverted in 2010, which represents approximately 0.1% by weight of the entire waste stream.
- Scrap Metal 190 tonnes of scrap metal material were collected in 2010, which represents approximately 0.5% by weight of the entire waste stream.
- Construction, Renovation and Demolition Waste 1,383 tonnes of construction, renovation and demolition (CR&D) material were collected in 2010, which represents approximately 3.9% by weight of the entire waste stream.
- Drywall 294 tonnes of drywall were diverted in 2010, which represents approximately 0.8% by weight of the entire waste stream.

### 3.5.2 DISPOSAL

The City of Peterborough disposed of 17,320 tonnes of residential waste in 2010, which is calculated as 218.3 kg per person and represents approximately 49% by weight of the entire waste stream. This consisted of: 12,134 tonnes collected from single- and multi-family households; 4,058 tonnes collected at the landfill depot; 979 tonnes of recycling and compost processing residues; and, 150 tonnes that were disposed from the MHSW Depot (Waste Diversion Ontario, 2011).

In comparison with other municipalities within the Medium Urban municipal grouping, the City's per capita waste generation rate is approximately 20% lower than the average (Table 2).

Program Name	Waste Disposed (kg/capita)
City of Guelph	193.59
City of Barrie	216.89
City of Peterborough*	218.30
City of Sarnia	247.02
City of Sault Ste. Marie	298.87
City of Brantford	330.57
City of Thunder Bay	341.43
AVERAGE FOR MEDIUM URBAN GROUPING	263.48

 Table 2
 2010 Waste Disposed for the Medium Urban Municipal Grouping

Source: (Waste Diversion Ontario, 2010).

\*2010 WDO Datacall

Households within the City are permitted to set out a maximum of two lifts of garbage per week for collection at curbside.

The PCCWMF will continue to provide waste disposal capacity for the County and City for approximately 12 to 15 years (from January 2011). Historically an assumed annual waste disposal rate of 60,000 tonnes (including IC&I and divertible material) and an assumed apparent waste density of 0.65 tonnes/ m<sup>3</sup> were applied (Genivar and Urban & Environmental Management Inc., 2011).

To determine future waste management needs, Cambium reviewed the future growth projections with the City and consulted the City's Official Plan Review. Based on these reviews, the City has projected a population growth of 88,000 by 2031. This projection coincides with the Greater Golden Horseshoe (GGH) Places to Grow Growth Plan policies. From this anticipated growth, we reviewed the tonnages and utilized the residential waste generation rate without divertible material of 218.3kg/capita and it can be projected that the annual residential waste disposal rate in over the next 20 years will be as follows in Table 3:

	2010	2016	2021	2026	2031
Population	79,334	81,436	83,594	85,810	88,041
Residential Waste (tonnes)	17,320	17,779	18,250	18,734	19,221

### 4.0 OPPORTUNITIES FOR INCREASING DIVERSION

This section summarizes the potential gaps between the City's current diversion of its various waste streams (based on 2006 waste audit data) and the goals and objectives identified in this Plan.

The City of Peterborough is considered an urban municipality, having over 150 multi-residential and many IC&I developments. Provincially, the City falls on the medium sized charts for comparison purposes with other cities of similar land uses and population densities.

As previously mentioned in Section 3.4, the City conducted its most recent formal waste audit in 2006. The findings from this audit were used in the diversion opportunity analysis, along with data from the 2010 WDO Datacall.

### 4.1 DIVERSION OPPORTUNITY ANALYSIS

By completing the analysis of diversion opportunity, it allows the City to review the amount of waste and recycling collected, the composition of this material, and the manner in which the material is received (i.e. in a garbage bag or blue box). Cambium has provided a summary of this information in tabular form for ease of understanding and presentation, in Table 4.

From the 2010 WDO Datacall report, the total residential waste and recycling generated in the City in 2010 was about 34,684 tonnes which includes backyard composting (BYC), the Beer Store (LCBO deposit, stewardship returns), WEEE, Reuse, CR&D recycling, MHSW, tires, scrap metal, leaf and yard, SSO, blue box material, and garbage. Of this total, 17,823 tonnes of the material was diverted while the remaining was disposed.

The 2006 Waste Audit indicated that organics comprised 30% of the total waste stream (City of Peterborough, 2006). A study entitled *Residential Waste Composition Study* (Ministry of the Environment, 1991) indicated that organics material comprises approximately 37% of residential solid waste in Southern Ontario. The number of 37% was used to estimate the total amount of material available in the waste stream.

To determine the amount of MHSW material remaining in the waste stream, the MHSW Program Plan (Stewardship Ontario, 2009) was used. This Plan provides for the end-of-life management of all MHSW materials under the Stewardship Ontario Program Plan. The Plan included an analysis of all MHSW material sold, available for collection, and reported collected and transported in Ontario over an eight-month period in 2008 and 2009. The total MHSW material available for collection Ontario-wide was reported to be 40,612 tonnes over eight months. This tonnage was then interpolated to determine the tonnage of MHSW material that would be available for collection annually within the City of Peterborough only. The result was that approximately 397 tonnes of MHSW material is available for diversion within the City annually.

Normally, to determine the amount of tires remaining in the waste stream, the Used Tires Program Plan (Ontario Tire Stewardship, 2009) would be applied. The purpose of this study is to foster the implementation of a sustainable used tire stewardship program in Ontario. This study included an analysis of the estimated uses of scrap tires within Ontario. The total used tires that are currently being recycled or disposed Ontario-wide was reported to be 106,500 tonnes. In the City of Peterborough, the Used Tires Program is very successful and there are many surrounding municipalities also participating in this program as well as local businesses. Tires are banned from disposal at the PCCWMF. It is assumed for this reason that 100% of the waste tires generated within the City of Peterborough are diverted from the landfill.

Table 4	Estimate of L	Divertible Materials	Remaining in	Waste Stream
---------	---------------	----------------------	--------------	--------------

	Material	Current Diversion <sup>1</sup>		Potential	Tonnes		
		Tonnes	Capture Rate (%)	% Diverted	Diverson (Tonnes)	Remaining in Waste Stream <sup>2</sup>	Potential Increase in Diversion (%)

Notes: 1. Source: 2010 Waste Diversion Ontario Datacall for the City of Peterborough

2. Source for Remaining Blue Box: capture rates from the 2006 waste audit for the amount of blue box material remaining in the waste stream

3. Source for Remaining WEEE: 70,659 tonnes of WEEE available for collection Ontario wide in 2004 (Table 2 of WEEE Study (WDO, 2005))

4. Source for Remaining Organics: 37% of waste stream is assumed organics (Page 1-3 of Residential Waste Composition Study (MOE, January 1991))

5. Source for Remaining MHSW: 40, 612 tonnes of MHSW available for collection Ontario wide over 8 months in 2008 and 2009 (Table 4.7 of Final Consolidated MHSW Program Plan (Stewardship Ontario, 2009))

6. Source for Remaining CR&D: 10 to 30% of waste stream is CR&D (Building for the Future: Strategies to Reduce Construction and Demolition Waste in Municipal Projects (May 11, 1998))

7. Tonnages of mattresses and carpet are unknown at this time and as such a conservative estimate was used based on information from a PCCWMF operator.

8. Assumes 100% capture rate

The potential diversion of 29,435 tonnes of material assumes that 100% capture rate is achieved and is provided here in order to illustrate what ultimately is possible. The purpose of the analysis is to clearly identify what is achievable for the City financially and realistically.

The analysis in Table 4 shows that the key opportunity for increasing diversion is through organics, specifically with SSO (food waste). Approximately 17% of the remaining waste stream is comprised of food waste. An additional 3.5% and 4.3% diversion can be achieved through capturing the available tonnes in the paper and plastics components of the blue box program, respectively. Likewise, there is an additional 5.0 to 8.0% diversion achievable with the removal of other recyclables such as mattresses, carpet and CR&D materials from the current waste stream. Overall, the percentage divertible is estimated to be 85%.

The total diversion potential is estimated to be 85% (assuming 100% capture rate).

### 5.0 OVERVIEW AND EVALUATION OF WASTE MANAGEMENT PLAN COMPONENTS

A set of diversion options were developed within pre-determined areas of interest in line with the already established goals, objectives, and measurable targets approved by the City and its public stakeholders.

The main areas of interest included the following:

- Goals, Targets, and Advocacy;
- Collection Services;
- Support and Incentive Options;
- Public Engagement and Education;
- Monitoring and Reporting;
- IC&I Recycling and Diversion Programs; and,
- Multi-Residential Recycling and Diversion Programs.

Within each of these target areas, a list of waste diversion options was identified. Each of the options was analyzed for the suitability with the City's waste management system.

### 5.1 EVALUATION METHODOLOGY

As previously noted, the City Steering Committee reviewed the list of waste diversion options against an established set of criteria. The criteria used in the evaluation included:

- Economic feasibility how economically feasible is the program and how does it compare against the others on a cost per tonne basis.
- Environmental effects (including waste diversion) what are the main environmental effects of the option (primarily represented as waste diversion).
- Social impact/acceptability how accepted is the option, measured by feedback received or as commonly received in other jurisdictions.
- Overall impression (includes sound approach/technology and ease of implementation) has this approach/technology worked in other similar jurisdictions.

The preferred waste diversion system is considered to be the one with the desired balance of advantages and disadvantages relative to the established goals and objectives. The evaluation was based on the priorities of the City and in consideration of the technical data available to date, advice from technical experts and input received from stakeholders (i.e. public, agencies, etc.).

## 5.2 COMMUNITY INVOLVEMENT

The City solicited involvement from the community at several critical points in the development of this document. The City hosted a public information centre (PIC) and designed an online survey to obtain information from local stakeholders, including permanent and seasonal residents, with respect to current and future waste management. The consultation program was designed to solicit information on current behaviours and to gain insight into the feasibility of waste diversion options based on user preference.

Notably, there is widespread support for the following program enhancements:

- maximize waste reduction;
- maximize waste re-use;
- maximize recycling;
- continue to maximize diversion of yard wastes; and,
- implement collection and processing of SSO.

### 5.2.1 PUBLIC INFORMATION CENTRE

Two PICs were held during the preparation of the Plan. The first PIC was hosted by the City at the Peterborough Public Library on Thursday October 27, 2011 from 2 pm to 3:30 pm and 6 pm to 7:30 pm. Notice of the date, time, and location for the PIC event was published in the Peterborough This Week and on the City website. A copy of the online survey was made available in hard copy at the PIC for residents to complete, and written comments could be submitted by attendees, if desired.

The first PIC was attended by City and Cambium representatives, who were available to provide information and answer questions at the request of attendees. An open house format was used for the PIC, with a poster board display containing pertinent information related to the development of the waste management master plan. In total, the afternoon and evening session of the PIC were attended by 18 people, in addition to City and Cambium representatives. Twelve copies of the survey were completed by attendees at the PIC event and were included in the tally with the same survey completed online.

The second PIC was held at the Green Expo on October 20, 2012 from 9am to 6pm at the Lansdowne Place Mall in Peterborough. Notice of the date, time, and location for the PIC event was published in the Peterborough This Week and on the City website.

A booth was set up with handouts and comment sheets for members of the public to provide input. The second PIC was attended by representatives from the City and Cambium with the ability to answer questions for the public where necessary. The display contained pertinent information related to the development of the waste

management plan. An online survey was available for the day of the PIC and printed surveys were also available for those that preferred the hand written option or were unable to stay to complete on the day of the PIC. Many people that would not normally have received the information participated in the feedback process and the second PIC was quite successful. In total, 60 surveys were completed at the time the report was issued with additional two comments sent via email of which the suggestions have been incorporated into the report.

The general public were asked to provide input on the draft WMMP which was posted on the City website but if they had not reviewed the document, City and Cambium staff provided a brief summary of what the WMMP entailed and the key recommendations identified in the report. The residents were asked to identify the top three diversion recommendations and the most preferred and least preferred disposal options such that the City may utilize this information going forward. The findings were as follows:

The top three diversion recommendations were:

- Identify recycling options for materials currently going to landfill incl. mattresses, carpet, textiles (72.7%)
- Develop an organics collection program (58.2%)
- Reduce garbage pickup and provide weekly recycling and organics pickup (56.4%)

The most preferred disposal options include:

- Increase waste diversion (81.8%)
- Use of alternative waste derived fuel technologies (42.8%)

The least preferred disposal options include:

- Exporting for any reason (landfill or incineration) (51.9%)
- Establishing a new landfill (29.8%)

General comments from the survey results in the second PIC are included in Appendix A for review.

#### 5.2.2 ONLINE SURVEY

An on-line survey was available for residents to complete at the beginning of the project from July 28, 2011 through to May 9, 2012. In total, 189 people completed the survey. A summary of the survey results, including all comments received is included in Appendix A.

Notable results from the survey included:

- The age demographic with the highest response to the survey was the 19 to 35 age range (35.7%) followed by the 36 to 50 year age range (34.6%).
- Approximately 80% of respondents resided in a single family home.

- 94% of respondents were permanent residents of the City of Peterborough.
- Greater than 83% of respondents generate one bag or less of garbage per week.
- Greater than 70% respondents generate two or more full blue boxes of recyclable material each week.
- Approximately 62% of respondents compost at home on a year round (42.3%) or seasonal basis.
- For the most part, respondents were satisfied or very satisfied with the current service levels for garbage and recycling.
- Respondents were less satisfied with the current service level for green waste; approximately 30% of
  respondents indicated that they were "unsatisfied" or "very unsatisfied" with the current service level.
  Comments provided suggested that many residents feel that green waste services should be increased to
  curbside collection of organics.
- 70% of respondents indicate that they use the MHSW and WEEE depots on an annual or seasonal basis, while 26.2% stated that they don't use these facilities at all.
- 68% of respondents stated that they would like to see the City reach a waste diversion target of 65%, which is 5% greater than the provincial goal.
- The five most preferred choices for increasing waste diversion were, in order of most to least popular: collection of food waste at the curb; increase the items that can be recycled in the blue box; establish a municipal reuse centre; reduce the number of bags permitted; and, mandate the use of clear bags.
- Greater than 81% of respondents indicated that they would participate in a curbside food waste collection program if it were offered by the City.
- 92% of respondents indicated that they would be willing to change personal behaviours to reduce waste generation, including: buying products with less packaging; participating in curbside food waste collection; and, using reusable shopping bags, among others.
- 65% of respondents would support the collection of garbage every second week (bi-weekly), if an enhanced recycling and food waste program were implemented. Approximately 25% indicated that they would not be in favour of this initiative.
- 59% of respondents were very concerned about potential impacts of landfilling waste, including; groundwater, biological, and surface water impacts, as well as odours and air emissions.
- The public identified that the top five criteria to evaluate future waste management options should be: positive environmental effects; positive social impact and acceptability; proven technology; cost/affordability; and, ease of implementation.

• Responses indicated approximately 64% of respondents would prefer waste management funding be obtained through municipal property taxes rather than user fees.

## 5.3 EVALUATION OF DIVERSION OPTIONS

A summary of the evaluated and recommended diversion options selected for the City, based on the current technology, trends, and conditions, is included in the following section. The most suitable options to increase waste diversion in the City have been divided into six areas for discussion purposes:

- Promotion and Education (P&E)
- Enhancement of Diversion Programs
- System Optimization
- Multi-residential Recycling and Diversion
- Policy and Enforcement
- IC&I Waste Recycling and Diversion

In addition to the evaluation criteria discussed in Section 5.1, it is important to note that the implementation of the waste diversion options is likely to occur over several years, with some options requiring substantial lead time for public notification, planning, financing, and preparation. With this in mind, each option has been assigned a timeframe with respect to implementation.

All options evaluated that are not considered to be viable at this time are available for reference in Appendix C. It is important to note that this plan is a living document, and that this list of options should be reviewed by the City on an ongoing basis, to ensure that the most appropriate options are implemented as conditions change and the needs of the community bend to environmental, financial, and political fluctuations.

### 5.3.1 PROMOTION AND EDUCATION (P&E)

The City is committed to developing creative, efficient, and cost effective methods to promote waste diversion and management initiatives and to educate residents and businesses about the importance of maximizing waste diversion. A variety of factors contribute to the patterns of waste generation and disposal, including; product choices, consumption patterns, economic influences, multi-level policies and regulations, public attitudes, and busy lifestyles. As such, education programs for waste reduction should promote behavioural and social change, as well as communicate the correct information to allow people to make these changes.

An effective P&E program will:

• Create more awareness of the various waste issues.

- Achieve the eight Waste Management Best Practices established as one of the City's Key Targets. The report that provides the complete list of Waste Management Best Practices is included in Appendix D.
- Expand the number and type of education and outreach and/or partnership activities year over year, from 2010 levels.
- Enhance the community's knowledge and understanding of waste issues.
- Influence the community's values and attitudes.
- Encourage more responsible behaviour by the community.

As with all forms of education, it is understood that people learn and are motivated in different ways; therefore, messages to change behaviours surrounding waste generation, diversion, and disposal are most effective if they are reinforced throughout all venues (i.e. at home, work, and/or school). To this end, the P&E program should strive to involve business groups, residents, schools, the media, and community organizations. It is anticipated that with effective communication and education, combined with the correct supporting programs, the community will be motivated to take responsible action to reduce, reuse, and recycle their waste in a sustainable manner.

Several options were explored for the P&E program. The list of potentially suitable P&E options was reduced to the following three options for further evaluation:

Promotion and Education	Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
<b>Enhanced P&amp;E</b> Continue with current campaigns but also move into other outreach programs, social media, at various levels such as websites, twitter, Facebook (radio, newsprint, advertisements, signage, and prizes), presence at local events and open houses within the community, surveys, targeted campaigns, Sustainable Peterborough goals, IC&I recycling programs. Aim for an increase in blue box capture rates of 10% over 20 years.	~	~		2% to 3%	1
<b>Staff Training</b> - Attend training and workshops, industry meetings (MWA, SWANA etc.)	✓	~		1%	1
Schools Programming Enhancement, expand and formalize	~	~		1%	2

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

As illustrated above, enhanced P&E and training were the most preferred options for the City at this time, and are discussed in detail in the following sections. Only options that receive a ranking of 1 (most suitable) are recommended at this time to be the City's top priorities. Each year the options will be re- assessed in light of

current conditions to ensure that the options moving forward are relevant. A summary of the strengths and challenges for all P&E challenges is provided in Table 5.

### 5.3.1.1 ENHANCED P&E – GENERAL

Enhanced P&E includes the use of existing City, public, or provincial tools and resources to promote waste diversion, with enhancements to target the particular conditions of the City to increase the diversion rate. Examples of resources that can be used to encourage participation in waste diversion initiatives include:

- Media: City website, blogs, advertisements, articles, press releases, radio spotlights, new social sites;
- Educational Resources: local events and targeted campaigns; and
- Promotional Materials: permanent and mobile signage, stickers/labels, calendars, supporting other City programs including Sustainable Peterborough.

These promotional resources can be focussed toward the topic of waste diversion in general, or can be directly related to problematic materials or particular diversion targets that are not being met (i.e. increasing the diversion of plastics, or addressing blue box materials contamination).

Enhancing Peterborough's general P&E program will serve to increase the population's general knowledge of waste diversion programs, and is anticipated to increase waste diversion by up to 3%. The cost to adequately enhance the program is estimated to be approximately \$80,000 per year, at a minimum.

The current budget of \$60,000 per year for general P&E should be increased to \$75,000 per year to allow for more television, radio and social marketing campaigns, which will reach new and expanded audiences. Best practices suggest \$1.18 per household, which equates to over \$41,000.00 for recycling promotions alone. Additional promotional materials, entry fees, etc. for public recycling events and multi-residential working group will require another \$5,000 per year.

## 5.3.1.2 ENHANCED P&E – LARGE FUTURE CAMPAIGNS

In addition to the general P&E program that the City runs each year, special campaigns for new programs and initiatives being introduced will need to be accounted for in the appropriate annual budgets. As these new programs become a permanent part of the City's Waste Management System, additional general P&E funding to maintain awareness and participation in them will need to be considered.

Some examples of specific P&E campaigns that may fall outside the general programming budget include:

- Source Separated Organics program
- Expanded schools programming
- A multi-residential promotional campaign

• IC&I diversion programs

The P&E program will relate to all diversion options presented in the City WMMP and, as such, these sections may overlap in content. P&E is directly linked to all aspects of waste management be it collection, processing, or end use and final disposal. The more informed waste management system users are, the better the waste management system will be.

### 5.3.1.3 STAFF TRAINING

Currently the City has a small budget for training courses, workshops and seminars for staff, to ensure that the City is informed and up-to-date on the upcoming trends, technologies, and options available for waste management and diversion. Ensuring that all relevant City staff are informed of these aspects is essential to the success of waste management and for the development and implementation of a thriving P&E program. Training also allows for networking opportunities with peer groups, which will provide valuable insight into the application and success of P&E programs used elsewhere. It is estimated that the portion of a P&E budget assigned to staff training should be approximately \$5,000 per year in order to keep up with the latest technologies.

Table 5	P&E Strategies – Summary of Strengths and Challenges
---------	--

Opti	Option Strengths		Challenges
On-	Going General P&E	<ul> <li>Reach a broad audience</li> <li>Flexible presentation</li> <li>Cost effective</li> <li>Support for waste diversion programs</li> </ul>	<ul> <li>Preparation of materials can be time intensive</li> <li>Materials may become dated quickly</li> <li>Continual modification to materials is required to maintain public interest</li> </ul>
	SSO	<ul> <li>Rejuvenate participation in existing programs (green waste, blue box)</li> <li>Measurable organic diversion</li> </ul>	<ul> <li>Staff time/costs</li> <li>Additional waste stream overwhelming for residents</li> <li>No facility</li> </ul>
P&E Campaigns	Multi-Residential Programs	<ul><li>Measurably increase diversion</li><li>Allows for open communications</li></ul>	<ul> <li>Staff time/costs</li> <li>Limited participation from landlords/tenants</li> </ul>
Future P	School Programming	<ul> <li>Cost effective</li> <li>Reach a broad audience</li> <li>Work within the existing P&amp;E programs</li> </ul>	<ul> <li>Staff time/costs</li> <li>Providing necessary tools to maintain feedback and interest</li> </ul>
	IC&I Programs	<ul><li>Measurably increase diversion</li><li>Develop a working group</li></ul>	<ul> <li>Staff time/costs</li> <li>Ongoing support and feedback for new programs</li> </ul>
Staf	f Training	Learn new and innovative ways to help reduce waste	<ul><li>Staff out of office</li><li>Costs</li></ul>

### 5.3.2 ENHANCEMENT OF DIVERSION PROGRAMS

As with the P&E evaluation process, a number of options were reviewed to enhance diversion programs currently used or planned for the City, which led to the selection of six main options. The identified six options were further evaluated for suitability to the current needs and conditions of the City's residents and waste management system. Each option was reviewed to determine which would improve upon diversion rates in the most environmentally, socially acceptable, and financially feasible manner.

Four of the options were identified as most viable for the City at this time. Enhanced diversion options are being established to assist with the key targets developed by the City to achieve the Goals and Objectives of the proposed Plan and the specific targets that relate to enhanced diversion include:

- 1. Improving the residential diversion rate from the 2010 level of 50% such that the target of 75% over 20 years will be an achievable goal, with a review of target every five years.
- 2. Improving the capture rates for blue box materials such that the rates will increase 10% from 2006 levels over 20 years, with a review of target every five years.
- 3. Setting the participation rate to 50% in year 1 of the proposed SSO program with an increase for each year of the program.

Enhancement of Diversion Programs	Enhancement of Diversion Programs Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
<b>Establish new and enhance existing markets</b> as practical for materials e.g. textiles, pet waste, wood waste, durable goods, shingles, carpeting, mattresses, CR&D	~		~	5% to 8%	1
Waste Exchange/Reuse Center - Establish a waste exchange and reuse centre with a non-profit partner to enable residents to donate and exchange reusable goods. Common for reuse centre to be established at landfill or transfer station.		~	~	1% to 3%	1
<b>SSO Collection</b> - Establish a residential curbside collection and processing program for SSO materials.	✓			17%	1
Public space recycling - Install recycling containers in high traffic areas, especially where evidence of container use is pronounced. Includes outdoor parks, trails, and public facilities. Investigate public/private opportunities.	~		~	1% to 3%	1
Expand the list of eligible Blue Box materials	✓		✓	<1%	3
<b>Special events diversion and recycling</b> - Establish a City policy for events which makes recycling mandatory. Make it part of the permitting process.	~		~	<1%	3

A summary chart is provided below for illustration purposes.

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

Because the City already accepts as wide a range as is possible in its blue box program, expanding the list of blue box eligible items was not considered to be relevant. Implementing a program for special events diversion and recycling, while worthy endeavours, did not score high enough in their potential for diversion to be ranked as #1 priorities The most suitable (Ranked #1) options are discussed in the following sections and summarized in Table 6.

### 5.3.2.1 ESTABLISH NEW AND ENHANCE EXISTING MARKETS

Currently the City collects many materials for diversion through the blue box, MHSW, and WEEE, as well as other diversion programs such as drywall and CR&D programs at the PCCWMF on Bensfort Road. However, there are still more items that could be separated and diverted from landfill. These include but are not limited to:

٠	textiles	٠	asphalt shingles	•	pet waste	•	wood waste	
---	----------	---	------------------	---	-----------	---	------------	--

carpeting
 mattresses
 durable goods
 food waste (organics)

### Textiles

Textile refers to clothing, curtains, linens, towels, table clothes and other fabric items. Textiles can be separated from waste collection and, instead of disposal at the landfill, the material can be sent to various charitable organizations for reuse and recycling for such uses as polishing cloths and pet bedding at animal shelters. The City is currently investigating as many options as possible for removing this waste type from the disposal stream. Participation will depend on the level of knowledge, understanding and effort by the residents (i.e. curbside collection or drop off locations).

### **Asphalt Shingles**

One substantial ongoing issue at the PCCWMF is that of the disposal of asphalt shingles. Asphalt shingles can be sourced back to contractors for use in road asphalt. Recycled Asphalt Shingles (RAS) is a product that contains approximately 30% asphalt cement by mass weight. Sources of RAS include trimmings from shingle insulation and decommissioned shingle roofs. Reuse of these materials leads to financial savings through avoidance of disposal costs, saving of air space, and reduction of the amount of virgin asphalt binder required in hot mix asphalt.

The University of Waterloo's Centre for Pavement and Transportation Technology, CPATT, is committed to working with public and private sector partners to develop sustainable technologies with respect to the transportation industry. A white paper was prepared as a result of a recent study involving Miller Paving Limited, CPATT, and Materials Manufacturing Ontario (MMO). There is more interest every day on the asphalt shingle

and the RAS end use market. The City would need to identify and work with a producer such as Miller Paving with equipment that is able to remove the nails and grind the shingles to make them suitable for recycling.

#### Pet Waste

Pet waste is an issue for many municipalities. When residents walk their dogs, they tend to use plastic bags to collect the waste and the combined package is disposed of. A conventional plastic bag mummifies the feces until the plastic bag breaks down, which can take hundreds of years.

Cat waste presents a host of other issues, including toxoplasmosis, which is a protozoa found in cat feces that can wash into streams, rivers, and oceans through septic systems, sewage pipes, yards, and landfills, that can infect birds, rodents, shellfish, and sea otters, causing illness and even death in these creatures. Some residents with cats dispose of waste by flushing it down the toilets. The excess clumping litter made of clay and/or silica can cause impacts to the drains as it can build up over time.

The City has many options moving forward to deal with pet waste, including:

- promotion of eco-friendly cat litters made of corn and free of clay or silica;
- Biodegradable pet bags for collecting waste in public. These are only relevant if used in conjunction with pet waste digesters;

Installation of pet waste composters or digesters in public areas, and/or the promotion of installing these units in people's own yards. It should be noted that pet waste should not be placed in the BYC nor should pet waste be included in an approved SSO program without further review, as there are pathogens that will not be readily removed during this process. Pet waste composters and digesters are designed to specifically alter the waste using enzymes which results in a benign residue. Should there be a program that becomes available to the City which processes both biosolids and SSO, the City may be able to revisit the pet waste diversion for incorporation into that program.

#### Wood Waste

Unlike metals and plastics, wood is renewable and represents an inexhaustible resource if properly managed. In 2004, a study was completed by Natural Resources Canada (NRCan) which concluded that 875,000 tonnes of wood waste was disposed of from CR&D projects in Canada each year (Forest Echo, 2011). As much as 20 to 30% of the wood used in new home construction ends up as waste material or, worded differently, for every new 2,500 square foot home constructed, it is estimated that there will be two metric tonnes of wood waste (Forest Echo, 2011).

Builders and home owners can integrate reclaimed wood during their renovations such as old doors, trim and flooring from the deconstruction of older homes. An example of a supplier for these materials is the ReStore in

Peterborough and www.legacyvintage.com out of Cobourg, Ontario. The facility in Cobourg specializes in reuse and recycling of vintage homes and historical building components.

A program should be developed to encourage wood waste diversion by homeowners and the IC&I sector. The diversion program should support local, existing reuse initiatives (reuse centre and charitable organizations), that are further described in Section 5.3.2.2. The success of the program would be contingent on there being adequate space for storage of wood waste at the reuse centre, and the hours of operation being supportive of the CR&D industry. If these conditions are satisfied, the participation by the residents and the IC&I sector is likely to be positive.

In addition to direct reuse, clean wood waste can be recycled for use as a bulking agent with the leaf and yard waste compost facility, sold as mulch, animal bedding, reused for furniture or composite wood products or used to produce biomass energy.

The City does already divert a portion of its wood waste through its CR&D recycling program. The program was touched on in Section 3.5.1.5 and is discussed further below. Currently, CR&D waste is separated when entering at the PCCWMF and diverted or at the source by general contractors with sorting and separation undertaken by M&M Disposal at the recycling facility in the Township of Douro-Dummer.

### Mattresses

Based on discussions with landfill staff, there is currently about 50 mattresses per day being disposed at the PCCWMF. When reviewed with historical amounts and projected over the coming years, it can be anticipated that the number of mattresses disposed will be 10,000 to 15,000 per year. One mattress equates to 0.75m<sup>3</sup> of air space and the City should look at adding this item to the list of banned materials on the by-law.

### Carpet

Cambium also recommends that the City review the option of adding carpet as an item that should be banned from landfill disposal. It is bulky and consumes a large amount of air space. There are a number of companies that are capable of separating the carpet materials down to the original fibres for recycling and within reasonable distances to the City.

### Construction, Renovation, and Demolition Waste (CR&D)

The diversion opportunity analysis completed in Section 4.1, indicates that approximately 9.5% of all waste generated in the City is considered to be from a CR&D source. Approximately 4.5% of CR&D (including scrap metals) is currently diverted through existing programs. Due to the nature of CR&D waste, this waste stream is well suited to recycling initiatives; however, the waste stream is comprised of a variety of components (i.e. wood, metal, and interior and exterior building materials), which requires the waste to be sorted to make it suitable for

reuse. Some of the CR&D waste is not reusable or recyclable due to size, condition, or other factors, and the only suitable option for this waste is disposal.

Several options were considered to increase the diversion of CR&D waste, which included:

- Promotion of sustainable policies including zero waste principles and extended producer responsibility (EPR). To explain further, the City would promote the use of Leadership in Energy and Environmental Design (LEED) construction and sustainable policies with CR&D projects, the preparation of a waste reduction plan for each project, or sorting the waste at the site prior to disposal (e.g. drywall from wood from metals). In addition, the City would try to promote deconstruction versus demolition thereby saving bricks, windows, doors, stair rails, mantels, and so forth for reuse in other homes. For EPR, the City would support using manufacturers and suppliers that are considerate of packaging and disposal requirements (e.g. use minimal recyclable packaging, biodegradable packaging);
- Including proper CR&D waste handling as a condition for construction, renovation and demolition permits.
   Once again, the City could promote careful deconstruction versus demolition of buildings through the requirement of a waste reduction plan in the building permit process;
- Establish and promote a reuse centre at the PCCWMF and promote the use of local reuse centres already established within the City; and,
- Provide CR&D waste collection for small amounts of residential CR&D waste for a fee, similar to the current large article collection system.

A program to manage CR&D should be prepared in conjunction with an overarching plan for management of waste generated in the IC&I sector. It is anticipated that enhancements to the CR&D program could result in an increase in the residential diversion rate of the City of 5.0%, assuming 100% capture. Implementation costs would involve policy development through building permits and enforcement protocols, as well as promotion and education materials, advertisements, and marketing materials. Operational costs would be staff time to enforce and monitor (audit) the collection and diversion of this waste type.

## 5.3.2.2 WASTE EXCHANGE/REUSE CENTRE

An effective way to minimize waste is to encourage reuse of products and materials that have not reached the end of their effective life. Currently, the City does offer "Reusable Exchange Weekends" on a monthly basis from May through September. Through this initiative, residents are encouraged to place usable items that are no longer wanted at the curb, where any passerby is able to select items for reuse, free of charge. It also encourages reuse through a Take It Back feature on its website and through periodic articles and promotions. None of these initiatives generate any quantitative data on the volume of material that is ultimately diverted, or at least postponed, from landfilling.

As previously mentioned, builders and home owners can integrate reclaimed wood during their renovations such as old doors, trim and flooring from the deconstruction of older homes. While one builder or home owner may not An example of a supplier for these materials is the ReStore in Peterborough and www.legacyvintage.com out of Cobourg, Ontario. The facility in Cobourg specializes in reuse and recycling of vintage homes and historical building components.

It is recommended that the City investigate the possibility of establishing a waste exchange and reuse centre at the existing PCCWMF for residents and the IC&I community to utilize. The City could possibly work with postsecondary institutions and/or local charitable organizations for the operation and management of the centre. Such a facility may be used as a central location for residents, or as a transfer station that is coordinated with a local community or not-for profit program such as Habitat for Humanity and Re-Store, the Canadian Diabetes Association, St Vincent de Paul or the Salvation Army as well as the Lakefield Animal Shelter and other private charity organizations. A permanent facility such as this would draw large numbers of users once people became aware of it, and larger volumes of materials would be diverted from the tip face. It would even be possible to quantify the amount, by having people weigh out their materials.

## 5.3.2.3 SSO COLLECTION

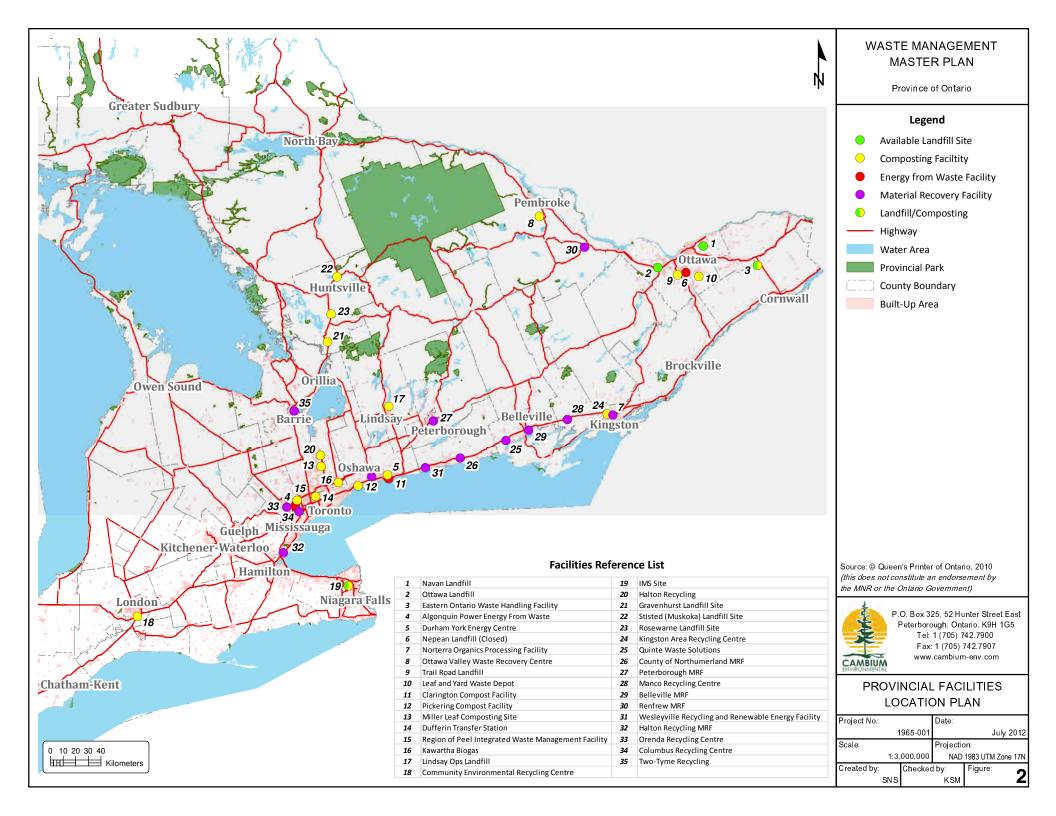

Organics typically make up about 37% of residential waste. The study entitled *Residential Waste Composition Study* (Ministry of the Environment, 1991) supporting this percentage is included for reference purposes in Appendix D. The organics waste stream is generally divided into two types: 1) leaf and yard waste and 2) food waste. The diversion opportunity analysis indicates that virtually all leaf and yard waste generated in the City is diverted through its Green Waste Collection program, which equates to 14.1% of all waste generated in the City. As there is a by-law in place to enforce the Green Waste program, it is anticipated that the capture rate will continue to be close to 100%. It is in the area of food waste (SSO) where the City can realize the greatest potential for gains in diversion – approximately 17%, according to the diversion opportunity analysis in Table 4.

The City currently has a small pilot area where SSO is collected for composting. Some municipalities are working jointly with private companies such as Durham with Miller to collect and process their SSO materials. Other municipalities such as the District of Muskoka have their own compost facilities that they operate and process the SSO as well as leaf and yard and biosolids materials. Costs vary from municipality to municipality depending on the feedstock to be included in the program (biosolids, fats, oils greases (FOG)), what the end product is to be, what type of technology will be applied, the collection process, whether the residents will use green bins or bags, and so forth. Based on a study undertaken by FCM, collection costs are estimated to be approximately \$100/tonne and processing costs range from \$40 to \$150/tonne depending on the complexity of the system.

To accommodate the processing of food waste, the City would require significant upgrades to its existing composting system. The use of alternate technologies, exploring public/private partnerships, or export of the SSO to a suitable processing facility in another jurisdiction would need to be investigated.

A comprehensive review and survey of Canadian SSO and household organics facilities was completed by the Recycling Council of Alberta (RCA) and Municipal Waste Integration Network (MWIN) in April 2006 (RCA & MWIN, April 2006). A component of that study was to estimate capital and operating costs for typical compost technologies. The RCA/MWIN study developed capital and operating costs based on the actual quantity of organics that may be generated within municipalities of various populations and on real data from operational facilities in Canada. Total costs for capital and operation of compost facilities ranged from \$40 to \$60 dollars per tonne per year (\$/tonne/yr) for a turned windrow process and up to \$100 to \$150 /tonne/yr for an anaerobic invessel facility (RCA & MWIN, April 2006). These estimates exclude collection costs. Figure 2 illustrates the locations of current composting, waste management, and MRF facilities already approved and operating within the province in relation to the City of Peterborough.

## 5.3.2.4 PUBLIC SPACE RECYCLING

Consistent with the anticipated increase in diversion through continued promotion of the existing blue box program, providing recycling opportunities in public spaces would serve to further increase that diversion. The City has numerous parks and recreational areas that are widely used by residents and tourists alike. While some of these locations have already been equipped with designated receptacles for waste and recyclables, the majority of public spaces currently provide either only garbage collection or no collection at all.

Public space recycling is considered to be consistent with the best management practices target that was established and reported at the beginning of the Plan. A public space recycling program will help the City achieve the diversion target of 75% that it has set for the next 20 years. It also serves to reinforce the public's awareness of the importance that the municipality places on waste management and recycling.

Option	Strengths	Challenges
New Markets for Diversion	<ul> <li>Increased landfill capacity</li> <li>Increasing divertible material types will directly affect diversion rate</li> <li>Positive public perception</li> <li>Create niche job opportunities for processing and salvage</li> </ul>	<ul> <li>Processing infrastructure required for some materials</li> <li>Staff time</li> <li>Costs for recycling</li> </ul>
Waste Exchange / Reuse Centre	<ul> <li>Positive public perception</li> <li>Win/win for public and City</li> <li>Possibility to work with non-profit organization to offset costs</li> </ul>	<ul><li>Tracking impact of activities</li><li>Costs associated with implementing</li></ul>
SSO Program	<ul> <li>Large increase in diversion possible</li> <li>Converted to a beneficial end product (compost)</li> <li>Growing social acceptance</li> </ul>	<ul> <li>High capital and operating costs</li> <li>No policy to force participation</li> <li>No local processing facility</li> </ul>
Public Space Diversion	<ul> <li>Positive message to the public and visitors to the area</li> <li>Increased diversion</li> <li>Potential for advertising on bins for other diversion programs</li> </ul>	<ul> <li>Initial capital costs</li> <li>Staff time</li> <li>Cross contamination</li> </ul>

Tabla 6	Diversion Program E	nhancements – Summar	ry of Strongths and Ch	llongos
I able 0	Diversion Program E	innancements – Summar	y of Strengths and Ch	alleliges

### 5.3.3 SYSTEM OPTIMIZATION

The waste services currently provided by the City involve a number of optimization measures that make waste collection, disposal, and diversion convenient for residents, such as:

- a 24 hour recycling depot;
- a weekly two stream recycling program;
- a year round depot for all MHSW and WEEE; and,
- weekly leaf and yard waste collection (seasonal).

A number of options were reviewed that can be expected to further optimize services for residents, to increase participation in waste diversion initiatives, and to create cost efficiencies. Four options were chosen for further evaluation:

System Optimization	Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
<b>Pick-Up Frequency and Collection Optimization</b> - Implement bi-weekly pick-up of garbage once an SSO program is established (weekly collection of organics)	<ul> <li>✓</li> </ul>	~	~	3%-7%	1
<b>Regular Waste Audits</b> - Complete waste regular waste audits to confirm composition, identify problem areas and to determine available material for recovery.	<ul> <li>Image: A second s</li></ul>	~	<ul> <li>✓</li> </ul>	N/A	1
<b>True System Costs</b> - Complete waste flow and full-cost accounting tools using gap or similar analysis, to show where best savings can be found through diversion.			~	<1%	3
Waste Management Utility - Explore the possibility of a waste management utility, whereby all waste management activities are operated and funded as a separate utility.			~	<1%	3

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

The full list of options that were evaluated are included in Appendix C and will be reviewed annually by the City as environmental, financial, and political conditions change and impact the needs for different strategies.

Following the evaluation process, it was concluded that modifying the pick-up frequency and completing regular waste audits are the most suitable options in the short term to optimize current and future waste management in the City. A summary of the strategies is included in Table 7.

### 5.3.3.1 PICK-UP FREQUENCY AND COLLECTION OPTIMIZATION

The current weekly collection frequency of waste is adequate for the City, based on the diversion programs that are presently offered. If the City implements curbside collection of SSO, the collection frequency should be reviewed and modified to optimize participation in this program. The two stream recycling collection and SSO collection should both occur every week. These diversion programs combined should leave very little else in the garbage stream of participating residents, thereby making bi-weekly garbage collection viable. The less-frequent collection of garbage would further encourage participation in the diversion programs.

In most municipal waste management systems, the collection of waste and recycling is the most expensive aspect. A 1995 study undertaken by the Solid Waste Association of North America (SWANA) indicates that about 50% of waste management costs are incurred through collections (SWANA, 1995). Modifying the pick-up frequency has successfully improved the level of participation in diversion programs in other municipalities and has also reduced the costs of collection.

Some additional ways to improve and optimize collection include: routing optimization, using automated collection equipment and possibly modifying the types of collection vehicles to accommodate different waste streams and programs on the same truck.

### 5.3.3.2 REGULAR WASTE AUDITS

The City completed a full waste audit in 2006 and is undertaking an updated waste audit in 2012 to verify waste composition and diversion data. It is recommended that the City perform waste audits on a more frequent basis following the implementation of the options within this Plan, in order to determine if the recommended strategies are bringing the City closer to meeting the targets identified in Section 1.4.

It is recommended that the City maintain ongoing seasonal waste audits to track the progress of the strategies to be implemented with the Plan.

Audits can be used to track the performance of the diversion strategies and programs recommended in this Plan, following their implementation. The audits highlight areas that should be targeted for increased P&E, based on observations of divertible materials that continue to be seen in the waste stream instead of the recycle stream. In this way, audits improve on the efficiencies of waste collection and processing by confirming that only residues and unmarketable material are shipped to the PCCWMF. Conducting waste audits demonstrates the City's commitment to diversion and sustainability, and a desire to improve the performance of the waste system.

Option	Strengths	Challenges
Pick-up Frequency	<ul><li>Cost savings</li><li>Increased diversion</li></ul>	<ul> <li>Mixed public response to curbside collection</li> <li>Long term implementation</li> </ul>
Regular Waste Audits	<ul> <li>Document waste composition</li> <li>Allow for accurate tailoring of P&amp;E programs to target key materials</li> <li>Measure success</li> <li>Provide valuable feedback</li> </ul>	<ul><li>Staff time</li><li>Voluntary participation</li><li>cost</li></ul>

Table 7	System Optimization – Summary of Strengths and Challenges

### 5.3.4 MULTI-RESIDENTIAL RECYCLING AND DIVERSION

O. Reg. 103/94 requires any owner of a building containing six or more residential units to implement a source separation program for waste, provided that the building is located within a municipality with a population greater than 5,000 persons. If these buildings are located in a municipally serviced curbside collection area, such as the City of Peterborough, the municipality is responsible for the collection of the waste. Research has shown that many building owners that are obligated to provide source separation programs are unaware of the requirements of O. Reg 103/94 (KPMG, 2007); therefore, an effective P&E campaign directed toward multi-residential property managers could go a long way toward increasing waste diversion rates from this sector.

Even established multi-residential recycling and waste diversion programs throughout the Province face a number of cultural and structural challenges not experienced by curbside programs. The result is poor recycling participation and waste diversion rates from multi-residential buildings. In general, reasons for low waste diversion rates have been linked to language barriers, transience, lack of ownership, peer pressure/anonymity, inconvenience, material contamination, lack of financial incentives, lack of support by building management, and ineffective existing infrastructure (GENIVAR, May 2010).

A list of options for the multi-residential sector was reviewed, and five options were selected for further evaluation, as identified in the table below. All other options reviewed are included in Appendix C for future consideration. Waste management legislation, social acceptance, environmental conditions, and financial implications all change; with these changes, the City will need to re-evaluate the Plan regularly. A summary of the strengths and challenges is included in Table 8.

Multi-Residential Recycling and Diversion	n Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
<b>SSO Collection</b> - Establish a Green Cart collection for SSO in MR buildings so service consistent with SF households (Phase 2 of SSO Program)	~			2% to 3%	1
<b>Multi-Residential Working Group</b> - Establish a Multi-Residential Working Group with City and superintendent reps that meets on a regular basis to discuss waste diversion challenges and strategies	~	~	~	<1%	2
Feedback to buildings - Provide feedback to residents on how their particular building is doing (using graphics, etc.)	~			<1%	3
<b>Designated goods diversion</b> (e.g. Electronics, batteries, textiles) Establish specific collection programs in multi-residential buildings to divert designated goods for recycling/reuse	~			1%	3
Waste diversion info provided to new and existing tenants - Establish protocol with building owners to provide waste diversion educational packages to new and existing tenants on an annual basis	~			<1%	3

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

A single option was determined to be most suitable for implementation in the City at this time; SSO collection for multi-residential buildings. The City should include multi-residential buildings in the development of the SSO program such that all implications, including full financial and environmental costs and benefits, are accounted for when establishing the program. The program would require consultation with representatives on behalf of landlords and tenants, SSO green carts suitable for the various buildings within the City, as well as communication efforts and targeted P&E programs specific to the multi-residential housing sector.

It is generally recommended that the City include multi-residential developments in the P&E program, with a focus toward informing owners and property managers of obligations under O. Reg. 103/94 and outreach to residents with a demographically appropriate information package.

Option	Strengths	Challenges
SSO Collection	<ul> <li>Could be included in the phased in development of City-wide SSO program</li> <li>Large quantities of organics can be collected in one location</li> <li>Positive public perception (equal services and requirements as single family households)</li> </ul>	<ul><li>Participation</li><li>Cross-contamination</li><li>Cost</li></ul>

Table 8 Multi-Residential Recycling – Summary of Strengths and Challen
--

### 5.3.5 POLICY AND ENFORCEMENT

The successful implementation of many of the diversion options presented in the Plan will be dependent on local, regional or provincial policy support, and local enforcement. Adequate staffing with trained personnel is critical to the enforcement of policies that will ensure efficiencies in procurement and contract management as well as operations and collections. Existing policies and enforcement enable the City to have the current impressive diversion strategies already in place; however, increased enforcement of key programs (CR&D, IC&I) will be required to meet the goals and objectives proposed within this Plan and to achieve the aggressive but achievable diversion targets.

Several policy based approaches were reviewed to encourage participation in the blue box program. Participation in the blue box program is already high; however, policy approaches considered to further increase participation included clear bags for garbage, a bag-tag system, landfill/disposal bans, and the enforcement of mandatory recycling and source separation by-laws (materials bans). Sustainable procurement programs and policies were also explored as options to increase the diversion rate.

The policy and enforcement options evaluated are provided below.

Policy and Enforcement	Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
<b>Stronger enforcement of Landfill/Disposal Bans</b> - Designated materials are prohibited from being disposed at the landfill or disposal facility	~			1% to 2%	2
Stronger Enforcement of Curbside Bans and lift limits at the curb	~	~		<1%	2
Green Procurement and Sustainable Procurement Programs within the City - Develop a corporate policy that encourages green procurement (work with Sustainable Peterborough policies)			~	<1%	2
Joint Procurement Policy with other municipalities - Wherever feasible, consider making joint purchases with other neighbouring municipalities to take advantage of volume discounts			~	<1%	2
<b>Bag-Tag/Pay-as-you-throw</b> - Financing strategies used to promote waste diversion including full or partial Bag Tag systems, variable and hybrid variable rates, pay by collection frequency, variable carts rates, weightbased garbage collection, possibly supported by RFID technology	~	~	~	1%-4%	3

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

The policy and enforcement initiatives considered during this review were not ranked in the top options for immediate action. The City already has mandatory recycling as part of its garbage collection, as well as landfill bans for specific materials. A reduced bag limit is recommended for consideration following the successful implementation of the SSO program. Enforcement of the bans and bag limits should be audited on a regular basis to ensure the bans and bag limits are being enforced and the message is clear and consistent.

The Bag-Tag/Pay-As-You-Throw option scored low in our ranking, due to a perceived reluctance by the public to accept a fee-for-service program. However, it is strongly recommended that variations on this theme be considered by the City. A bag-tag or clear bag system has been used in other municipalities with proven success at increasing diversion, and this is something the City may wish to explore in the future.

As previously noted in Section 3.1, the City enacted a by-law (Chapter 594 Garbage Collection) which defines green waste and recyclable material and stipulates that it is illegal to dispose of recyclables as solid waste. The City also developed bylaw 07-027 which clearly lists a number of materials that are banned from being disposed of as garbage at the County/City facility. Chapter 594 excludes several other materials from the definition of garbage. Copies of these by-laws are included in Appendix B for reference purposes.

Materials banned from disposal at the PCCWMF include:

•	hazardous waste	•	blue box materials	•	clean wood waste	•	drywall
•	green waste (leaf and yard materials)	•	scrap metal	•	tires	•	explosive or highly combustible material
•	building materials	•	automobile parts	•	hot material	•	industrial waste

It is recommended that the City review and update its existing waste management bylaws.

"Green procurement" decisions include consideration of resource sustainability, environmental impact, waste reduction, and local production in municipal purchasing decisions. One option for green procurement is that of extended producer responsibility (EPR) and supporting legislative changes to endorse more EPR by reducing the amount of waste generated at source. The EPR framework assigns responsibility to producers to generate less waste materials including packaging, disposable items, and items that are not readily recyclable or disposed of. EPR means that product manufacturers are responsible for the full life cycle costs associated with their products including the environmental costs of production and managing the product at the end of its life, whether that be for reuse, for recycling, or safe disposal. Packaging bans, fees (such as for plastic bags), and levies have proven useful in motivating producers and consumers to reduce the generation of waste at the source, or at the point of purchase for some waste types.

Much of the waste managed by the City is produced outside the local area, and is transported into the City by commercial establishments, businesses, and residents in the form of various consumer products and packaging. In some jurisdictions in Ontario, political lobbying is being undertaken or considered to motivate the Government of Ontario to impose the principles of EPR on manufacturers and producers of products to reduce the volume of waste generated at the source of production.

Waste related impacts can be reduced through the implementation of other green procurement policies, such as making "green" purchasing decisions. For a product to be considered "green" it should be made from recycled or sustainable materials, have a limited amount of packaging, and be sourced as locally to the end use of the product as possible. Green procurement policies encourage product producers to use alternative sources of raw materials, such as recycled materials. In so doing, overall support to waste minimization and diversion measures is generated, by providing a market for the materials being recycled.

The City should consider implementing green procurement policies at municipal facilities, which would include the consideration for resource sustainability, environmental impact, waste reduction and local production in municipal

purchasing decisions. Green procurement policies can include sourcing and using environmentally friendly products in the work place, such as natural cleaning supplies, biodegradable bags and 100% recycled paper.

To reduce the cost of these items, the City could initiate a purchasing partnership with a neighbouring municipality such as the County, to buy green products in bulk for a lower fee or reduced shipping costs. The City already has several joint purchasing policies in place and is seeking opportunities to increase purchasing efficiency through new partnerships.

The City should continue to enforce and implement policies for sustainability and has adopted the Sustainable Peterborough Plan which promotes the preparation of waste management plans and reduction policies in support of building permits.

## 5.3.6 IC&I WASTE RECYCLING AND DIVERSION

Statistics Canada estimates that approximately 67% of waste generated in Canada is from non-residential sources, which is consistent with the same statistical comparison for the Province of Ontario, where 66% of waste is non-residential (Statistics Canada, 2010). City staff reported that 57% of the waste stream for the City was from non-residential or IC&I in 2010. Given that such a significant percentage of all waste generated is from non-residential sources, it is imperative that waste management planning be cognisant of opportunities to increase waste diversion in the IC&I sector.

As noted by the Federation of Canadian Municipalities (FCM, March 2004), the majority of IC&I waste is composed of recyclable or compostable material, with 85% of the typical composition of waste comprised of mixed paper, corrugated cardboards, food waste, plastics, and ferrous metals. All of these materials are divertible, with the proper infrastructure in place. Assuming a capture rate of 85% for divertible IC&I materials, the City could expect to realize an overall diversion rate increase of 38% through waste diversion in the IC&I sector alone.

There are several policies and programs in place in Ontario which could target IC&I waste for increased diversion. Five regulations, referred to as the 3Rs Regulations, were made under the Environmental Protection Act in March 1994 to promote waste diversion among designated IC&I and CR&D generators:

- O. Reg. 101/94: Recycling and Composting of Municipal Waste; *amended by O. Reg. 251/11*.
- O. Reg. 102/94: Waste Audits and Waste Reduction Workplans; *No amendments*.
- O. Reg. 103/94: Industrial, Commercial and Institutional Source Separation Programs; *amended by O. Reg.* 230/11.
- O. Reg. 104/94: Packaging Audits and Packaging Reduction Workplans; No amendments.
- O. Reg. 105/94: Definitions (Amendments to Regulation 347); amended by O.Reg. 234/11.

These Regulations apply to IC&I waste generators, including: hospitals, hotels and motels, office buildings, restaurants, retail shopping establishments and complexes, educational institutions, manufacturing, and demolition and construction projects. The Regulations prescribe source separation requirements for businesses of different sizes and are mostly targeted toward large IC&I generators. Policies and programs should be considered to increase waste diversion for smaller businesses that are not required to comply under the Regulations. Some municipalities have had success in encouraging waste diversion from the IC&I sector by implementing by-laws requiring IC&I facilities to implement recycling programs.

With this in mind, it is recognized that the current level of staffing within the City's Waste Management Division would not be sufficient to implement, monitor or enforce IC&I diversion programs.

IC&I Waste Recycling and Diversion	Objective Satisfied				
Strategy Enhancement Option	1	2	3	Diversion Potential	Ranking
SSO Implementation - Implement a user-pay SSO program for IC&I sector (Phase 3 of SSO program)	~				2
Build IC&I Database - Make database for use to manage and monitor solid waste programs	~	~		TBD	3
Designated goods diversion - Specific diversion programs established small IC&I to divert designated goods for recycling/reuse and expand to larger IC&I gradually.	<b>~</b>				3

A short list of options were evaluated for improved diversion in the IC&I sector:

Note: Objectives are 1) Maximize Diversion; 2) Minimize Generation; and, 3) Fiscally Responsible

Based on the evaluation, all options were determined to be only marginally suitable for the City to pursue at this time. This WMMP is generally based upon the residential waste stream and detailed data on IC&I waste volumes and composition within the City is not known. It is recommended that further study of waste generated and disposed from the IC&I sector should be undertaken to determine current disposal and diversion rates.

While SSO implementation in the IC&I sector is not feasible at this time, this program could be extended to IC&I after it is developed and implemented for residential waste in the City. At that time, it is recommended that the City seek local and regional partners to develop a strategy for managing and handling divertible IC&I waste to realize some, if not all, of this potential diversion opportunity.

Some basic options that should be considered when planning for waste management related to IC&I waste include:

- Increase staffing levels;
- building an IC&I database to manage and monitor solid waste programs;
- enhancing the City's website with a section dedicated to IC&I waste management and diversion matters;
- developing a targeted P & E strategy for IC&I that would provide support and tools to generators on how to maximize recycling opportunities;
- implementing financial penalties for poor performance or failure to meet recycling or compostables targets;
- terminating waste collection and/or landfill service for failure to participate in the recycling program, or to meet identified minimum targets for waste diversion;
- promoting the diversion of designated goods (i.e. MHSW, WEEE, textiles) through the implementation of specific collection programs for small IC&I generators to divert such goods for recycling or reuse; and,
- requiring generators to complete and submit Recycling Plans to the City for review and approval.

### 5.3.7 ANTICIPATED DIVERSION AND ASSOCIATED COSTS

There are many options available to increase waste diversion in the City and the list previously reviewed will provide the City with some flexibility to choose the most suitable options for their area.

Several key goals should be considered as the driving force for an increase in waste diversion, including;

- preserving waste disposal capacity at the PCCWMF and other active waste disposal sites;
- providing up to date and accessible services for residents;
- increasing the efficiency of the waste management system; and,
- generating opportunities for cost savings.

Table 9 below includes a list of the preferred waste diversion options, as determined through the evaluation of all options discussed in Section 5.3. The options have been ordered according to the projected implementation timeline (i.e. short, and long term) and then by greatest to least potential for increased diversion within their strategy grouping.

Strategy	Option	Increased Diversion Potential (%)	Annual Net Cost Per Household	Implementation Timeline
Promotion and Education (P&E)	Enhanced P&E	2% to 3%	\$2 to \$3 <sup>1</sup>	S
	Staff Training	1%	\$0.5 to \$1 <sup>1</sup>	S
	SSO Collection	17%	\$20.00 <sup>2</sup>	S – M
Enhancement of Diversion	Establish New and Enhance Existing Markets	1% to 3%	TBD	S
Programs	Waste Exchange/Reuse Center	1% to 3%	\$1.00 <sup>3</sup>	S – M
	Public Space Recycling	1% to 3%	\$2.23 <sup>4</sup>	S
System Optimization	Pick-Up Frequency and Collection Optimization	3%-7%	7% savings <sup>5</sup>	М
	Regular Waste Audits	N/A	\$1.79 <sup>6</sup>	S
Multi-residential Recycling	SSO Collection	2% to 3%	\$0.67 <sup>7</sup>	M - L

 Table 9
 Anticipated Cost and Diversion Rate Increase by Diversion Option

Note: S = short term (1-2 years); M = medium term (3-5 years); L = long term (>5 years); TBD = to be determined

5. (2cg, October 2011)

6. Based on waste audit cost data provided by the City of Peterborough.

7. (Stantec, June 2010)

## 5.4 DISCUSSION OF WASTE DISPOSAL OPTIONS

The City is currently focusing significant effort on increasing waste diversion in order to extend the life of the current landfill and improve upon the amount of air space remaining. Notwithstanding this effort, waste continues to be generated and the City is aware that they need to start assessing alternatives for waste disposal while pursuing aggressive waste diversion targets.

As part of the public consultation process for this Plan, a survey was distributed to residents on the City website and at PICs to determine the public opinion on the preferred waste disposal method for the City. The following two notable comments on waste disposal were provided from the City's survey:

- 59% of respondents are very concerned about potential impacts of landfilling waste, including; groundwater, biological, and surface water impacts, as well as odours and air emissions.
- The public identified that the top five criteria to evaluate future waste management options should be: positive environmental effects; positive social impact and acceptability; proven technology; cost/affordability; and, ease of implementation.

The general public also indicated that they wanted to see an increase in diversion. Accordingly, the City views diversion as the primary goal, but disposal will always be a vital and important component of the future waste management system.

The PCCWMF will continue to provide waste disposal capacity for the County and City for approximately 12 to 15 years (from January 2011) based on an assumed annual waste disposal rate of 60,000 tonnes (City and County combined) and an assumed apparent waste density of 0.65 tonnes/m<sup>3</sup> (Genivar and Urban & Environmental Management Inc., 2011). The assumed annual waste disposal rate noted above includes waste from all sources, including residential and IC&I waste.

To prepare for filling the existing disposal capacity at the PCCWMF, the City will be required to complete an environmental assessment (EA) under the Environmental Assessment Act (EAA) to gain additional disposal capacity, or to manage residential waste in an alternative way (i.e. thermal treatment, anaerobic digestion). The City intends to move forward with the EA process in partnership with the County to determine the most suitable option for waste disposal for both jurisdictions into the future.

It is recommended that the City undertake a formal review of waste disposal technologies on a regular basis (i.e. every three to five years) as part of its solid waste management planning program, which will lead into the EA process.

Some of the options and technologies that currently exist and should be investigated in the EA process include:

- 1. Expanding capacity at current facility;
- 2. Developing a new landfill;
- 3. Anaerobic digestion (AD); and,
- 4. Thermal treatment.

Most of these waste disposal options would be subject to major studies, municipal and provincial approvals and possibly federal approvals. The intent of the studies and approvals is to make sure that the expansion or creation of a new facility, and subsequent operation, does not have a negative impact on the environment. Components of the environment considered in the required studies include natural, cultural, social and economic aspects. Significant supporting studies are prepared to assess potential impacts to the components of the environment, as presented above, which may result from each disposal option. Public and aboriginal consultation is a fundamental component of the EA process.

The following major studies and approvals would be required, at a minimum:

- An individual EA must be completed and then approved by the province under Part II of the EAA and Ontario Regulation 101/07 Section 2(1)1; and,
- Approval under the EPA and Ontario Regulation 232/98, related to landfill site investigations and design.

In the case of waste disposal site expansions and new site development, the time required to complete an EA and obtain all of the necessary approvals is approximately five to eight years. Due to the considerable time commitment required to complete the EA and approvals process, it is recommended that the City work with the County to initiate the process within the next five years.

# 6.0 WASTE MANAGEMENT PLAN IMPLEMENTATION

Key targets have been developed, which will serve to help the City reach their goals and objectives, as identified in Section 1.4. As a review, the key targets are as follows:

## **KEY TARGETS**

- Expand the number and type of education and outreach and/or partnership activities year over year from 2010 levels.
- Meet all eight Waste Management Best Practices as outlined in the Blue Box Program Enhancement and Best Practices Assessment Project Report, 2007, prepared by KPMG LLP, a Canadian advisory services firm (as outlined in Section 1.4).
- Residential diversion rate will increase from 2010 level of 50% to 75% over 20 years, with a review of target every five years.
- Capture rates for blue box materials will increase 10% from 2006 levels (79.5%) over 20 years, with a review of target every five years.
- Participation rate of 50% in year 1 of the proposed SSO program with an increase for each year of the program.

The development of this Plan has included:

- review of the existing waste management system;
- identifying gaps in the current system, from infrastructure and operations points of view; and,
- evaluation of various options and strategies to improve the waste management system and remain in line with the key targets.

The Plan is a living document and, as such, the options and strategies should be reviewed annually with the key targets reassessed every five years to ensure that the City remains in line with the current regulatory and social circumstances, while meeting the needs of residents and those in the IC&I sector.

In this section, ongoing monitoring protocols are recommended to the City for the Plan to remain effective and relevant. There is a brief discussion of proposed community engagement, possible partnerships and ongoing collaboration, to ensure that the Plan is well received by waste system users. Suggestions on ways to review and assess the progress and success of the implementation of the programs identified in the Plan are provided.

The City has identified some methods to move toward Green Economic Development, with guidance from Peterborough Green Up initiatives and the Sustainable Peterborough Plan, and some of these ideas are promoted through this Plan. As the provincial and federal governments take greater interest in municipal waste management, more options may become available for the City to work with these levels of government for additional economic development strategies.

## 6.1 MONITORING AND IMPLEMENTATION SCHEDULE

It is recommended that an annual review of the proposed diversion strategies and the list of diversion options available to the City (as provided in Appendix C) be undertaken. Every five years, it is recommended that the City undertake a detailed assessment of the goals, objectives and key targets as future social, environmental and regulatory environments may or may not be applicable to the original targets established upon commencement of the planning process.

Ongoing monitoring of the progress of this Plan is proposed as follows:

- feedback from online surveys;
- feedback from public events;
- feedback from operations and contract staff; and
- waste audits conducted regularly.

An implementation schedule should be developed by the City to ensure that the steps taken to develop and execute the Plan are making the intended impact.

## 6.2 COMMUNITY ENGAGEMENT

There are many methods that the City can adopt to involve and engage the community in the implementation of this Plan. With the planning process that accompanied the preparation of this document, City and Cambium staff were involved in presenting to the public via newspaper ads, radio advertisements, and online surveys and through two public information centres. There has been an increasing trend in participation in waste management planning among major stakeholders and public infrastructure development in recent years. The City is aware of this increased interest, and has been looking at ways to embrace this change.

The following four steps will be used to engage the community in the adoption and implementation of this Plan. The success of reaching the goals and objectives outlined in the Plan is contingent upon a high level of participation from the community, including the public, municipal partners, and the IC&I sector.

## 6.2.1 INFLUENCE AND INFORM

Some governments have been utilizing the "community engagement ladder" and with each government and individual department, this ladder varies but generally stated this term means, "*if you give a person the tools necessary to make an effective and informed decision, they will make the legitimate choice*". The City is able to influence or inform the members of the public and affected community through the use of various tools, including:

- media management,
- advertising;
- new social media websites;
- public events; and
- seminars.

The purpose of informing and influencing the stakeholders would be to provide them with the necessary information to increase their awareness of a specific program (e.g. SSO program, enhanced diversion, or CR&D diversion) or with general knowledge to influence their use of the system (e.g. informing residents of the issue of blue box materials contamination).

Educational or one-way campaigns would be recommended for new enhanced diversion programs such as adding textiles to the recycling or asphalt shingles. For large scale new programs or waste system modifications, such as SSO or possibly the development of a new facility to manage the organics stream, the City would require a more in-depth approach such as the consultation process discussed in the next section.

### 6.2.2 CONSULT AND INVOLVE

By consulting and involving major stakeholders, and/or residents and members of the public, the City is able to fully appreciate and understand the issues, concerns and values presented. The consultation approach is normally practiced when there are issues that may involve perceived uncertainties or gaps in truth that need to be clarified by City staff, or in instances involving technical information that needs to be presented to the public and stakeholders in layman's terms. Areas of concern and stakeholder values and questions are constructively discussed between the City and respective parties through workshops, public information centres, surveys and committee meetings.

### 6.2.3 PARTNER AND COLLABORATE

In some large projects, municipalities have selected to use a collaborative approach which involves cooperation between major stakeholders, operations staff, senior management and consultants. This approach, which is referred to as "value engineering", is a worthwhile tool that enables the City to meet with interested parties to find

common ground at various stages of a project. By partnering and collaborating with the community on larger projects and possibly establishing a committee to achieve this, all parties are represented and it becomes a consensus decision making process.

As previously noted in Section 1.1, the City shares waste management services with the County and, as such, should consider partnership and collaboration with the County with any future waste management planning strategies. Currently, the City has an ongoing relationship with the County through the ongoing management of the PCCWMF, use of the MRF, and provision and promotion of diversion programs. It is recommended that the City continue with the current relationship and look for opportunities to collaborate with the County on other waste management strategies in the future.

Community partnerships and collaboration are also possible. An example of a community based partnership is to encourage and facilitate diversion and reuse among the large student population in the City. It is recommended that the City work with the post-secondary institutions by establishing a working group to find efficient and economical solutions to reuse and recycle the items that are currently tagged and disposed of. It should be noted that there are funding opportunities that may exist for collaboration of this type, which are further discussed in Section 6.5.

### 6.2.4 EMPOWER

Through a community engagement and consultation process, the City ultimately provides the residents and community with the tools necessary to act responsibly and decide through their actions what the future of waste management will be and how they can impact decisions in the years to come. The residents need to be involved and actively participate today in order to minimize costs, financially and environmentally, for the years to follow. The City can influence and inform, consult and involve, partner and collaborate, but the residents have the ultimate power to make the changes necessary.

## 6.3 GREEN ECONOMIC DEVELOPMENT

As recently seen and heard in the newspapers and on television reports, the Province of Ontario is proposing to move towards a zero waste future. Initiatives will be introduced to aid in the reduction of solid waste, increase diversion and to build a more green and sustainable economy through the Green Energy Act. The recommendations made in this Plan are consistent with these initiatives, and support moving toward a zero waste future.

The City can use this Plan, and the recommendations proposed within, as a starting point to build their economic development plan. The green and sustainable options selected through the development of this Plan will create jobs, reduce disposal costs, and will possibly have a positive payback for the community turning what typically would be deemed a liability into an asset.

### 6.3.1 JOB CREATION

With the proposed waste diversion and management options outlined in this Plan, several new job opportunities will be created. For example, the proposed facility for organics processing, reuse centre and possible option for increased diversion of CR&D materials will create a minimum of one position for each option discussed, be it through policy and enforcement, promotion and education staffing, or directly at the new facilities in operations. A recent report completed by Lura Consulting (2010) indicates that the biggest source of job creation and further economic spin-off for the community would be realized by supporting provincial EPR programs and the reduction and recycling of CR&D materials.

### 6.3.2 FINANCIAL RECOVERY FROM DIVERSION

From a financial outlook, by diverting more materials as proposed in Section 5.3.2, the City will be maintaining the waste disposal capacity available at the PCCWMF for disposal of non-recyclable, non-reusable or non-divertible material. The increased diversion will save the City funds over the long term by postponing the capital investment required to obtain approvals for a new waste disposal option before the capacity at the existing facility is depleted. The potential sale of reuse material and the new markets identified for sale of divertible materials (e.g. recyclables, CR&D) may also provide additional financial support to the City. Funding opportunities for the development of a reuse centre may exist with the federal or provincial government. While no financial gain is necessarily implied, there could also be green economic benefit by collaborating with the post-secondary institutions in the City for reuse strategies.

In addition, cost savings could be realized through the development and implementation of a new facility for organics processing, be it composting, anaerobic digestion or thermal treatment, from which energy could be generated and used internally or sold, as discussed in the following section.

### 6.3.3 ENERGY PRODUCTION

Some composting systems have been adapted to collect heat from the organic material during the composting and curing process as a source of renewable energy. Heat capture is achieved through glycol, air or water and can be used to generate energy from compost. Captured heat could be used for direct heating of on-site buildings or for generation of electricity for other uses. This type of system should be considered when SSO collection begins.

Advancements in composting mixed materials have been made in recent years, and studies are currently being done on processes that involve the combination of SSO; leaf and yard waste; fats, oils and greases (FOGS) from IC&I; as well as biosolids and septage. Due to the recent advancements in this area, this system is an available option for processing organics for the City.

Other technologies such as anaerobic digestion (AD)and thermal treatment of waste are also options to be considered. Establishing an AD facility directly at the wastewater treatment facility is an option that could be explored, such that the biosolids haulage is eliminated from the financial statements, saving the City a tremendous amount in operating costs. A facility of this type is able to process SSO including pet waste as well as FOG. A new AD facility would be a large capital expenditure but would also create new jobs that would be sustained into the future.

The various forms of thermal treatment available are changing rapidly and the technology is improving each and every day. The ability for a municipality to financially justify constructing a thermal treatment facility is getting better with changes to government funding and legislation. Depending on the thermal treatment method selected, the City could process all organic waste and create many new jobs as well.

Both AD and thermal treatment would create energy which would off-set the capital and operating costs of these facilities and provide the City with a return on investment. The provincial government is highly supportive of green energy, as promoted through the Green Energy Act and feed-in-tariff (FIT) program.

## 6.4 MEASURING SUCCESS

At the present time, the City does not have dedicated staff to monitor and measure the performance of each aspect of the waste management system. Ideally, the City would be able to designate a staff member to review all waste audit information, complete the WDO datacall reports, and review and track waste disposal and diversion reports submitted by the collection and processing contractors; all of which would indicate how the programs are performing. The program's effectiveness can be measured by reviewing the following:

- Waste diversion rate which is to increase from 50 to 75% over 20 years (by 2030);
- Capture rate for blue box material which is to increase by 10% from 2006 values;
- Disposal tonnage actually received at the PCCWMF; and
- Per capita waste generation rate (residential).

It is recommended that the City consider conducting a review of staffing requirements to accommodate the monitoring and tracking of the proposed strategies and options as outlined in the Plan.

## 6.5 FUNDING PROGRAMS

There are several opportunities available to municipalities for funding, and each opportunity or initiative has specific deadlines and requirements. Some of these initiatives may not be directly relevant to the City at this time; however, one or more of these programs may be applicable and relevant for collaborating with a post-secondary institution or establishing a public/private business partnership.

**FCM Green Municipal Fund:** Offers a range of resources and services that specifically address the sustainable community development needs of municipal governments. The Fund provides financing and knowledge to support the development of communities that are more environmentally, socially and economically sustainable.

**Building Canada Fund:** The Building Canada Fund in Ontario is a result of the Building Canada Infrastructure Framework Agreement signed between the governments of Canada and Ontario on July 24, 2008. This agreement represents more than \$6 billion in joint federal and provincial funding to help address infrastructure needs and priorities across the province. The priority funding categories for the Fund are Core National Highway System (NHS) routes, drinking water, wastewater, public transit and green energy. Other eligible investment priority areas include environmental projects (solid waste management), projects that support economic growth and development (short-line rail and short-sea shipping, connectivity and broadband, tourism and regional and local airports), as well as projects that contribute to the ongoing development of safe and strong communities (disaster mitigation, culture, sport, local roads and bridges, and brownfield redevelopment). Funding is used to support public infrastructure owned by provincial, territorial and municipal governments and entities, as well as private industry, in certain cases.

**Eastern Ontario Development Program:** Promotes socio-economic development in Eastern Ontario by creating, building and developing the necessary conditions to increase business and employment opportunities in the region.

**Investing in Business Innovation:** Boosts private sector investment in start-up businesses to accelerate the development of new products, processes and practices and to bring them to market. Funding is also available for angel investor networks and their associations to attract new investment and support the growth of angel investment funds.

**Technology Development Program:** Supports research and innovation organizations, the private sector, postsecondary institutions and not-for-profit organizations to work together to accelerate the development of largescale, advanced technologies that will result in new market opportunities for southern Ontario businesses.

# 7.0 KEY RECOMMENDATIONS

The City currently has a very successful waste management diversion program in place with the achievement of over 50% diversion. This Plan was commissioned to proactively investigate additional options and strategies to move toward improving the diversion from 50% to 75% over the next 20 years. This target is very aggressive, yet the review of waste composition and the potential gains from program enhancements completed in the development of this Plan have shown 75% to be an achievable target for the City.

It is important to note that the WMMP is a living document and the key recommendations and strategies are meant to be reviewed and adjusted according to current trends in governance and social behaviours. It is recommended that the City completes a review of the goals, objectives and targets every five years to ensure that they are still representative of the current needs of the City and its residents.

The following list details the key recommendations and findings as supported throughout the report.

## 7.1 DIVERSION

The top nine diversion options listed in the following Table 10 were identified through this study, as explained in Section 5.3. These are felt to be the best options to implement at this time, in terms of diversion potential, economic viability, and social acceptance. These recommendations are provided in the order of most diversion potential to least diversion potential.

In addition to the nine key recommendations in Table 10, the City would be well advised to consider these additional recommendations as noted throughout the plan:

- Develop a working group with landlords and tenants to assist with P&E and aid in the development of SSO programs and other programs currently in place for multi-residential recycling (see Section 5.3.4);
- Review and update the current waste management by-laws (see Section 5.3.5);
- Review staffing requirements to accommodate diversion programs for the development, monitoring and enforcement in the IC&I sector given that the City could expect to realize an overall diversion rate increase of 38% through waste diversion in the IC&I sector alone (see Section 5.3.6);
- Continue to investigate joint initiatives with surrounding municipalities and other organizations (see Section 6.2.3);
- Review staffing requirements for the waste management division (see Section 6.4); and
- Investigate and review opportunities available to the City that may align with certain new and existing funding programs for municipalities (see Section 6.5).

Item #	Recommendation	Brief Summary	Increased Diversion	Timeline
			Potential (%)	
1	SSO Collection and Processing – Enhanced Diversion	Implement the SSO Program for approx. \$20.00/hh	17%	Short – Medium term
2	Establish New and Expand Existing Markets	New markets for: textiles, bulky items, asphalt shingles, pet waste, CR&D, and wood waste.	5% to 8%	Short term
3	Pickup Frequency and Collection Optimization	With new software and routing, the City could realize 7% savings annually.	3% to 7%	Medium term
4	SSO Collection and Processing – Multi- residential	Implement the collection of SSO to the current program for \$0.67/hh.	2% to 3%	Medium - Long term
5	Enhanced Promotion and Education	Increase the P&E budget to enhance programs by \$2.00 to 3.00/hh.	2% to 3%	Short term
6	Waste Exchange/Reuse Center	Consider establishing at the existing PCCWMF for \$1.00/hh	1% to 3%	Short – Medium term
7	Public Space Recycling	Public space recycling to assist with enhanced diversion for \$2.23/hh	1% to 3%	Short term
8	Staff Training	Increase training budget for training of staff for \$0.50 to \$1.00/hh.	1%	Short term
9	Regular Waste Audits	Measure the success of the City's waste diversion system for \$1.79/hh.	N/A	Short term
	to make an and in Table O		•	

### Table 10 Summary of Key Recommendations - Waste Diversion

Note: Costs referenced in Table 9.

## 7.2 DISPOSAL

The following Key Recommendations will bring the City closer to identifying the most suitable means of waste disposal once capacity is no longer available at the PCCWMF.

- Conduct a true cost analysis of the landfill operations at the PCCWMF (see section 3.2.2)
- Investigate Suitable Options for Future Landfill Capacity
  - Monitor existing landfill capacity, landfill expansions and potential greenfield locations over time to allow the widest selection of suitable options.
- Undertake a Formal Review of Waste Management Technologies (see Section 5.4)
  - The City should monitor the progress of alternative technologies such as thermal treatment, AD facilities, and other established technologies. The review should be focussed toward technologies that have been proven to be both cost effective and reliable in North American municipalities that are of a similar size as Peterborough.
  - Reviews should be completed on a regular basis (every 3 to 5 years).
- Commence an EA Process (see Section 5.4)
  - The EA process should be initiated in cooperation with the County in order to identify the most suitable solution for waste disposal.
  - It is recommended that the City initiate the EA process a minimum of 8 years prior to reaching capacity at the PCCWMF, to ensure that sufficient time is allocated for necessary supporting studies.

### 8.0 CLOSING

## **GLOSSARY OF TERMS**

Adverse effect	<ul> <li>One or more of the following:</li> <li>(a) impairment of the quality, quantity, value or use of the natural environment;</li> <li>(b) injury or damage to plant or animal life, any person or property;</li> <li>(c) impairment of the health, safety or well-being of any person</li> <li>(d) rendering any property or plant or animal life unfit for human use; and</li> <li>(e) loss or changes to costs, revenues or economic opportunities for businesses and communities.</li> </ul>
Agricultural waste	Waste, other than sewage, resulting from farm operations, including animal husbandry and where a farm operation is carried on in respect of food packing, food preserving, animal slaughtering or meat packing.
Air	Open air not enclosed in a building, structure, machine, chimney, stack or flue.
Alternative method	Alternative methods of carrying out the undertaking are technically feasible and economically viable conceptual designs by which the undertaking could be implemented.
Alternative waste treatment	The processing of waste to recover resources and/or reduce its environmental impact.
Anaerobic digestion	A biological process using microbes to break down organic material in the absence of oxygen. Digestion takes place in an enclosed chamber, where critical environmental conditions (e.g., moisture content, temperature and pH levels) can be controlled to maximize microbe generation, gas generation, and waste decomposition rates.
Approval	Permission granted by an authorized individual or organization for an undertaking to proceed. This may be in the form of program approval, Certificate of Approval or Provisional Certificate of Approval.
Approved site or facility	A landfill site or waste management facility with a current valid Certificate of Approval.
Approved site or facility	A landfill site or waste management facility with a current and valid Certificate of Approval.
Aquifer	A geologic formation that is saturated with water.
Asbestos waste	A non-hazardous waste in solid or liquid form, originating from the removal of asbestos-containing construction or insulation materials (ACMs) or the manufacture of asbestos-containing products.
Ash	The non-combustible, solid by-product of incineration or other combustion process.

"At-source"	A waste minimization or management activity occurring at the source of waste generation.
Attenuate	To weaken, to lessen, to make smaller (e.g. to lower the concentration of a contaminant in ground water).
Background concentration	The amount of a chemical in the soil, groundwater, air or sediment in the environment that would be considered representative or typical of conditions in a given area or locality.
Backyard compost (BYC)	Composting of residential organic materials by a household, usually in the backyard. Generally considered a method of source reduction.
Bag tag	A clearly identifiable sticker approved for sale by resolution of the Council of the Municipality and used to indicate that a fee has been paid.
Baling	The process of compacting and binding mixed solid wastes to form a compressed block or bale.
Berm	In a landfilling site/facility, a narrow elevated earthen mound which surrounds the waste deposit area.
Best practices	Waste system practices that affect Blue Box and other recycling programs and that result in the attainment of provincial and municipal Blue Box and other material diversion goals in the most cost-effective way possible.
Bi-weekly collection	The collection of material set out at curbside one day every two weeks.
Biodegradation	A natural process of breaking down materials by decomposition/decay by the action of organisms.
Biogas	Gas formed during the anaerobic decomposition of organic material, mainly consisting of methane and carbon dioxide.
Biological treatment	A treatment technology that uses bacteria to process organic waste.
Biomass	Plant material, vegetation, or agricultural waste used as a fuel or as an energy source.
Bio-medical waste (BMW)	Waste products produced from healthcare premises such as hospitals, dispensaries etc. It is also known as Health Care, Medical or Clinical Waste.
Blue box	A plastic container, often blue in colour, for conveying acceptable recyclable materials. Also refers to a municipal curbside recycling program.
Bog	Wet spongy ground, a poorly drained usually acid area rich in accumulated plant

	material, frequently surrounding a body of open water, and having a characteristic flora (as of sedges, heaths, and sphagnum).
Borehole	A hole drilled or pounded into the earth that is used to determine soil, rock, and/or groundwater characteristics. A borehole can be used as a potable drinking water well, or as a groundwater observation/monitoring well.
Buffer area	The part of a landfilling site that is not a waste fill area.
Buy-back	A staffed facility that usually purchases post-consumer recyclable containers and materials, such as aluminum cans, glass, and newspapers from the public. May consist of mobile units. They seldom perform materials processing.
Canadian Council of Ministers of the Environment (CCME)	A council made up of environmental ministers from provincial and federal levels of government that proposed nationally consistent environmental standards and objectives to achieve high levels of environmental quality for waste management, air pollution and toxic chemicals across Canada.
Candidate site	A property identified as suitable for consideration as a potential site for a waste management facility.
Capture rate	The amount of materials recovered from the waste stream for recycling, typically measured in tonnes per person per year.
Cell	In respect of a landfilling site, means an area of a landfill that has been organized to receive waste and where to waste will be compacted and sealed by cover material so that the waste is not exposed to the atmosphere.
Centralized composting	A process using a central facility within a defined area to compost organic material.
Certificate of Approval (C of A)	A license or permit issued by the Ministry of the Environment for the operation of a waste management site/facility.
"Clean" recyclable or compostable material	Material collected in a source-separated program, where contamination is minimal.
Cleanfill	Clay, gravel, sand and soil that is not mixed with any waste or organic material and has been excavated from areas that are not contaminated with manufactured chemicals. This material is sometimes referred to as virgin excavated natural material.
Co-collection	The collection of recyclables and organics together with municipal garbage in one truck; separated later for recycling and composting/digestion or disposal.
Coefficient of variation	A statistical measure which permits a comparison of the amount of variation within sets of sample results which have different means. It is calculated by expressing the

sample standard deviation as a percent of the sample mean.

Collection	The process of picking up waste, recyclables, or compostable material from a household or business.
Commingled	Recycling programs where a number of different materials are mixed together, not collected separately.
Commingled recyclables	Materials recovered from the waste stream for recycling which are dry (e.g. paper, cardboard, plastic, glass)
Commercial waste	Waste originating from commercial businesses, and includes asbestos waste.
Commingled containers	Mixed food and beverage containers, usually plastic, metal and glass.
Community recycling centre (CRC)	A waste management facility that offers waste management services to small businesses and residents. A CRC is a place to drop off items such as electronics, white goods, household hazardous waste, leaf and yard waste, and blue box recyclable items.
Compactor vehicle	A collection vehicle using high-power mechanical or hydraulic equipment to reduce the volume of solid waste.
Composite liner	A liner system for a landfill consisting of an engineered soil layer and a synthetic sheet of material.
Composting	The controlled microbial decomposition of organic matter, such as food and yard wastes, in the presence of oxygen, into humus, a soil-like material. Humus can be used in vegetable and flower gardens, hedges, etc.
Composting facility/site	A facility/site licensed to process organic (i.e. plants) waste to produce compost
Construction, renovation & demolition waste (CR&D)	Solid waste produced in the course of residential, commercial, industrial, or institutional building construction, demolition or renovation (e.g. lumber, concrete, brick, plaster, glass, stone, drywall, wire, paint, etc.)
Contaminant	Any solid, liquid, gas, odour, heat, sound, vibration, radiation or combination of any of these, resulting directly or indirectly from human activities that may cause an adverse effect.
Contaminant attenuation zone	A portion of land that is located adjacent to a landfilling site, and is in the subsurface or extends into the subsurface. An attenuation zone is used to or is intended to attenuate contaminants from the landfilling site.

Contamination	A chemical which is present in soil, water, air, sediment, or other material at a concentration greater than background, or which is not naturally occurring in the soil, water, air, sediment or other material.
Control order	A direction by the Ministry of the Environment requiring a person/organization to change an existing operation to minimize adverse effect.
Controlled dump	A planned landfill that incorporates, to some extent, some of the features of a sanitary landfill: siting with respect to hydro-geological suitability, grading, compaction in some cases, leachate control, partial gas management, regular (not usually daily) cover, access control, basic recordkeeping, and controlled scavenging.
Corporations supporting recycling (CSR)	A Canadian, not-for-profit, private sector organization that works in municipalities and industries to aid in developing sustainable municipal recycling and waste diversion systems.
Cover material	Material used in sealing waste cells in landfilling operations.
Criteria	Numerical values for the concentrations of chemical substances in soil, water, air, and sediments that relate to the suitability of a site, for specific uses and land-use categories.
Curbside recycling	A program whereby individual residents separate recyclable materials from general wastes, and place them at the curb in bundles or designated containers for collection and further processing.
Decommissioning	The activities associated with closing all or part of a facility (e.g. the removal of process equipment, buildings and accessory structures, and the remediation of the surface).
Digestion	The biochemical decomposition of organic matter.
Deposit/refund system	Systems to collect fees on items when sold; fees are reimbursed when the used product is returned.
Design and operation (D&O)	A document (plan/report), required for obtaining a Certificate of Approval, which describes in detail the function, elements or features of a landfill site/facility, and how a landfill site/facility would function including its monitoring, and control/management systems.
Design capacity	The total volume of waste that has been calculated as having the potential to be disposed of at a landfill site for a particular landfill engineering design. This is typically measured in cubic metres.
Discharge	A volume of groundwater, surface water or leachate flowing past a given point over a time period. This is typically measured in cubic metres per second.

Disposal	Final placement or destruction of wastes. Disposal is typically accomplished through use of approved sanitary landfills or incineration with or without energy recovery.
Disposal bans	Regulation prohibiting disposal of materials or products (e.g., yard waste, or lead-acid batteries) in landfills and/or incinerators; typically targets items that contribute substantial volume or toxicity to the solid waste stream.
Disposal facilities	Facilities for disposing of solid waste, including landfills and incinerators, intended for permanent containment or destruction of waste materials.
Diversion rate	A measure of the effectiveness/efficiency of a program aimed at diverting materials in the waste stream from disposal. This is typically measured in tonnes of waste diverted per person per year.
Drivers	Considerations such as legislation, regulations, policies and other influencing factors.
Drop-off/depot	Facilities (staffed or unstaffed) where the public brings recyclable materials, organics, or garbage for management by the municipality. Separate drop boxes may be available for different materials, such as newspaper, glass, or metal.
Dump	A waste disposal site where waste is deposited without cover material being applied at regular intervals (i.e. A site not approved to accept waste).
Ecological receptor	A plant or wildlife species that may be affected due to exposure to a contaminant.
Ecological/ environmental risk assessment (ERA)	A scientific method used to examine the nature and magnitude of risks from the exposure of plants and animals to contaminants in the environment.
Effluent	A liquid discharged into a surface water body, onto the surface of the land, or into the local sewer system.
Engineered facility	<ul> <li>Anything man made that is intended to be a functional element or feature of a landfilling site for more than five years. The following things are examples of common elements or features of engineered facilities:</li> <li>berms,</li> <li>drainage ditches,</li> <li>liners,</li> <li>covers,</li> <li>pumps,</li> <li>facilities to detect, monitor, control, collect, redirect or treat leachate, surface water or ground water, and</li> <li>facilities to detect, monitor, control, collect, redirect, treat, utilize or vent landfill gas.</li> </ul>

l,	李	
-	ž	ļ
Ē	AMBILIA	٨

End use	The use of the landfill after reaching its capacity. Determination of the ultimate end use of the Site will be addressed in consultation with the public and other stakeholders.	
Energy recovery	The process of using wastes to generate energy, and can include capturing of methane gas from a landfill site.	
Environment	<ul> <li>As defined by the <i>Environmental Assessment Act</i>, environment means: <ul> <li>(a) air, land or water,</li> <li>(b) plant and animal life, including human life,</li> <li>(c) the social, economic and cultural conditions that influence the life of humans or a community,</li> <li>(d) any building, structure, machine or other device or thing made by humans,</li> <li>(e) any solid, liquid, gas, odour, heat, sound, vibration or radiation resulting directly or indirectly from human activities, or</li> <li>(f) any part or combination of the foregoing and the interrelationships between any two or more of them.</li> </ul> </li> </ul>	
Environmental assessment (EA)	A systematic planning process that is conducted in accordance with applicable laws or regulations aimed at assessing the effects of a proposed undertaking on the environment. Includes evaluation of need, alternatives, impacts, and mitigative, remedial, monitoring and/or compensatory measures.	
Environmental audit	A systematic process of objectively evaluating the degree to which an activity or undertaking is consistent with established criteria. These criteria are typically derived from a company's policies, procedures, and practices put into place to safeguard the environment. May also include health & safety practices, training, waste management, and transportation factors.	
Environmental impact assessment (EIA)	An evaluation designed to identify and predict the impact of an action or a project on the environment, human health and wellbeing. It can include risk assessment as a component, along with economic and land use assessment.	
Environmental site assessment (ESA)	A systematic process of determining whether a specific property is or may be subject to actual or potential contamination.	
Evaluation criteria	Evaluation criteria are considerations or factors taken into account in assessing the advantages and disadvantages of various alternatives being considered.	
Exports	In solid waste programs, municipal solid waste and recyclables transported outside the municipal jurisdiction or locality where they originated.	
Exposure	Contact between a contaminant and an individual or population. The exposure may occur through pathways such as ingestion, dermal absorption (through the skin), or inhalation.	

Extended producer responsibility (EPR)	A policy to shift the responsibility of a product's life cycle away from the municipality to the producers and to provide incentives for producers to consider the environmental impacts into the selection of materials and the design of the product.
Feedstock	The input material to be processed at a waste management facility.
Ferrous metals	Metals derived from iron or steel; products made from ferrous metals include appliances, furniture, containers, and packaging like steel drums and barrels. Recycled products include processing tin/steel cans, strapping, and metals from appliances into new products.
Fibre	Paper materials, such as cardboard, newsprint, and mixed papers.
Fill	Earth, sand, gravel, construction rubble, waste or any other material, originating on- site or off-site.
Fill area	In a landfill site, area receiving waste.
Flaring	The burning of landfill gas/methane captured and emitted from collection pipes at a landfill.
Flow control	Legislation that limits free market access to specific wastes and ensures their disposal at a particular processing or ultimate disposal facility.
Fluidized-bed incinerator	A type of incinerator in which the stoker grate is replaced by a bed of limestone or sand that can withstand high temperatures. The heating of the bed and the high air velocities used, cause the bed to bubble, which gives rise to the term "fluidized".
Fly ash	A highly toxic particulate matter captured from the flue gas of an incinerator by the air pollution control system.
Food waste collection	The collection of household organic waste such as food scraps and non-recyclable paper (tissues, paper toweling, etc.). It does not include yard waste. Food waste requires greater processing requirements than yard waste, so it is identified as a separate collection component.
Full cost accounting	Assigning all known waste management costs to the waste management program, including those shared with other operations or programs. May also be applied to landfills.
Garbage	Black/green bag or reusable container of waste set at the curb for disposal in the landfill. It has no practical or feasible further use; it cannot be recycled or biologically treated.
Grasscycling	Leaving grass clippings on the lawn and allowing them to decompose naturally instead of collecting them for composting, digestion, or disposal.

Green bin program	Diversion of organic wastes including food waste, non-recyclable paper and sometimes including diapers, sanitary products and pet waste. Term often used interchangeably with SSO.
Groundwater	Water beneath the earth's surface that fills underground pockets (known as aquifers), supplying wells and springs.
Half life	The time required for the concentration of a contaminant to diminish to half its original value.
Haul route	Public/private roadway(s) used by vehicles transporting waste to and from a landfill site.
Hazard	The adverse impact on health or property which results from the presence of, or exposure to, a contaminant.
Hazardous waste	Any residual hazardous materials which by their nature are potentially hazardous to human health and/or the environment, as well as any materials, wastes or objects assimilated to a hazardous material. Hazardous waste is defined by Ontario Regulation 347 and may be explosive, gaseous, flammable, toxic, radioactive, corrosive, combustive or leachable.
Heavy Metals	Metals of high atomic weight and density that are toxic to living organisms, such as mercury, lead, and cadmium.
Hierarchy (for waste)	A hierarchical method of solid waste management. The following practices are ranked in order of preference: source reduction; reuse; recycling; energy and material recovery; and landfill disposal.
High density polyethylene (HDPE)	A material used to make plastic rigid containers, milk and juice jugs, margarine tubs and detergent bottles. The plastic is translucent or opaque and does not crack when bent. Referred to as No. 2 Plastic.
Household hazardous waste	Substances labelled as corrosive, flammable, poisonous, or explosive originating from household use, which requires special handling for disposal.
Household waste (or domestic waste)	Solid waste composed of garbage and rubbish, which normally originates in a private home or apartment house.
IC & I waste	Waste originating from the industrial, commercial and institutional sectors.
Imports	Municipal solid waste and recyclables that have been transported to a jurisdiction or locality for processing or final disposition (but did not originate in that jurisdiction or locality).

Incineration	The use of solid waste as a fuel in a combustion process with the aim of reducing the volume of waste.
Industrial waste	Waste generated at an industrial operation; may be liquid, sludge, solid or hazardous waste.
Inert waste	Waste that is non-toxic, non-putrescible waste such as dirt, glass and wood that will not undergo any significant physical, biological or chemical changes once it is landfilled.
Inspection	Includes an audit, examination, survey, test and inquiry.
Institutional waste	Waste generated at institutions such as schools, libraries, hospitals, prisons, etc.
Integrated solid waste management (ISWM)	A strategic initiative for the sustained management of solid waste through the use of a comprehensive integrated format generated through sustained preventive & consultative approach to the complementary use of a variety of practices to handle solid waste in a safe and effective manner.
Integrated waste management system	Waste composed of material other than plant or animal matter, such as sand, dust, glass, and many synthetics.
In-vessel composting	Composting involving a closed tank or unit with physical controls.
Lagg	The perimeter of the Mer Bleu bog
Land	Surface land, including all subsoil, which is not enclosed in a building or covered by water.
Landfill gas	The gases produced from the wastes disposed in a landfill; the main constituents are typically carbon dioxide and methane, with small amounts of other organic and odour-causing compounds.
Landfill mining	Materials are recovered from a landfill by excavation. Organic matter may be reused as a daily cover, and material, such as wood, metal, brick, plastics and glass, may be recovered and recycled.
Landfill site	An approved, engineered site/facility used for the long-term or permanent disposal of waste. See also "approved site or facility" and "engineered facility".
Landspreading	A procedure whereby organic material is applied directly to land (usually agricultural) to improve the physical and chemical properties of soil.
Leachate	Liquid that drains from solid waste in a landfill and which contains dissolved, suspended and/or microbial contaminants from the breakdown of this waste.

Leachate pond	A pond or tank constructed at a landfill to receive the leachate from the area. Usually the pond is designed to provide some treatment of the leachate, by allowing settlement of solids or by aeration to promote biological processes.
Leaching	The process by which contaminants in the soil or wastes are dissolved and/or removed by water percolating or filtering through the soil.
Leaf & yard waste	Refers to leaves, grass, weeds, trimmings, brush, and woody materials (twigs, branches, etc.).
Liner	A protective layer, made of soil and/or synthetic materials, installed along the bottom and sides of a landfill to prevent or reduce the flow of leachate into the environment.
Litter	Any material left or abandoned in a place other than a receptacle or place intended for receiving such material.
Magnetic separation	The use of magnets to separate ferrous materials from mixed municipal waste stream or mixed recyclables stream.
Mandatory separation	A regulation requiring waste generators to separate designated recyclable or compostable materials from the waste stream for recycling.
Manual landfill	A landfill in which most operations are carried out without the use of mechanized equipment.
Manual separation	At a materials recovery facility, the separation or sorting of different materials in the waste stream by hand. Also referred to as hand sorting.
Markets	Persons, corporations, organizations or partnerships willing to purchase or accept in exchange for a fee, recyclable material processed through or at a recycling facility.
Market development	Policies or measures used by organizations or governments to stimulate demand for secondary materials (i.e., procurement policies, regulations, or mandated recycled content).
Massburn incinerator	A type of incinerator in which solid waste is burned without prior sorting or processing.
Materials recovery (or recycling) facility (MRF)	A facility where recyclable materials are processed through shredding, baling, pulverizing, separating, sorting, or otherwise treated or altered to facilitate further transfer, processing, utilization or disposal.
Maximum waste loading	For a landfilling site, the total waste disposal volume divided by the area of the waste fill area.

Mechanical separation	The physical separation of wastes by material type, size or density using trommels, cyclones, and various screens.
Methane gas	An odourless, colourless, highly-combustible gas often produced by the decomposition of waste in a landfill site. Methane is explosive in concentrations ranging from 5% to 15% by volume in air.
Microorganism	Any living organism that can only be seen with the aid of a microscope.
Mining	In a landfill, the excavation of previously buried waste to recover recyclable materials or soil for reuse.
Mixed MSW	A residual waste stream from the residential sector after some recyclables have been source separated. In some Canadian locations this stream is composted.
Mixed waste	Unsorted materials that have been discarded into the waste stream.
Mixed-waste processing	Through manual or mechanical means, some recyclable material is removed from waste. The remaining fraction may be used to make a fuel product, be composted, or both.
Modular incinerator	A relatively small type of pre-fabricated solid waste combustion unit.
Monitoring	A scientifically designed system of continued or periodic measurements or observations of environmental or operating conditions.
Monofill	A landfill intended for one type of waste only.
Multi residential buildings (MR)	Buildings which contain multiple self-contained residential dwelling units (typically greater than 6 units).
Municipal hazardous or special waste (MHSW)	Includes the following materials that are considered hazardous waste materials generated from the municipal sector (paints, solvents, adhesives, pesticides, acids/bases, aerosols, fuels and batteries). Also sometimes referred to as Household Hazardous Waste (HHW).
Municipal solid waste (MSW)	A waste type that predominantly includes household waste (domestic waste), except industrial and agricultural wastes, with sometimes the addition of commercial wastes collected by a municipality within a given area. The C & D debris and special wastes like hazardous wastes – usually not categorized under MSW - may also enter the municipal waste stream to an extent. It is sometimes also defined to mean all solid wastes that a city authority accepts responsibility for managing in some way.
Municipal solid	The controlled decomposition of municipal solid waste, including some form of

waste composting	preprocess to remove non-compostable material.
Natural environment	The air, land and water, or any combination or part thereof, of the Province of Ontario.
Non-ferrous metals	Non-magnetic metals such as aluminum, lead, and copper. Products made all, or in part, from such metals include containers, packaging, appliances, furniture, electronic equipment, and aluminum foil.
Non-hazardous waste	Non-hazardous wastes include all solid waste that does not meet the definition of hazardous waste and includes designated wastes such as asbestos waste.
Old corrugated cardboard	Bulky cardboard that is typically found in boxes used for shipping and packaging. It is made from two (2) strips of cardboard with a wavy, or "corrugated," strip running through the centre.
Ombrotrophic bog	A bog that receives most of its water and nutrients in the form of atmospheric precipitation.
On-site composting	Composting conducted at or near the (generation) source of the organic material.
Ontario electric stewardship (OES)	The Industry Funding Organization (IFO) for Waste Electrical and Electronic Equipment. Companies that are designated as stewards for Waste Electrical and Electronic Equipment can discharge their legal obligations under the Waste Diversion Act by registering, reporting and paying fees to OES.
Ontario tire stewardship (OTS)	The Industry Funding Organization established to develop a diversion program for Used Tires. Companies that are designated as stewards for Used Tires can discharge their legal obligations under the Waste Diversion Act by registering, reporting and paying fees to OTS.
Open dump	An unplanned "landfill" that incorporates few, if any, of the characteristics of a controlled landfill. There is typically no leachate control, no access control, no cover, no management, and many scavengers.
Operator	The person in occupation or having the charge, management, or control of a waste management system or a waste disposal site.
Organic waste	The organic fraction of the waste stream, consisting of material that is biodegradable, typically food, yard waste, and paper.
Overburden	The surface of the land which rests on bedrock, which consists of unconsolidated soil material.
Owner	Includes: (a) a person that is responsible for the establishment or operation of a

	waste management system or waste disposal site, or (b) the person that owns the land in or on which a waste disposal site is located.
Packer truck	Vehicle used for waste collection which compacts waste towards the rear of the truck.
Pay as you throw/User pay	A program in which every individual unit, bag or container set out for collection is paid for directly by the resident, commonly by the purchase of bag tags. Other examples of user pay systems would be the utility based system and the subscription based system.
Peripheral area	The area controlled by the site owner/operator between the property boundary of the waste disposal site and the actual fill area. This area may contain the buffer areas (as required). Together, the peripheral area and the fill area make up the waste disposal site.
Pest	Any injurious or noxious insect, fungus, bacterial organism, virus, weed, rodent or other troublesome plant or animal.
Pesticide	Anything that is designed to control, destroy, attract or repel a pest, typically in the form or a chemical, organism or device.
Pollutant	A contaminant other than heat, sound, vibration or radiation, and includes any substance from which a pollutant is derived.
Polyethylene terephthalate (PET)	A type of plastic that is clear or coloured transparent with high gloss. It is used for carbonated beverage bottles, peanut butter jars, and some household cleanser cleaners. Bottles have a raised dot on the base. PET is referred to as No. 1 Plastic.
Post-consumer materials	Materials that a consumer has finished using, and which may be sold, given away, or be discarded as wastes.
Practicable	Any action or activity that can be accomplished. Consideration is often given to the technical, physical and financial resources that are or can reasonably be made available.
Primary leachate collection system	A leachate collection system located below the waste fill zone.
Primary liner	The uppermost liner below the waste fill zone.
Private/self-haul	The waste generator (residence or business) can take garbage and recyclables to the waste facility directly or pay a private contractor to collect their waste materials.
Promotion and Education materials	Materials prepared and distributed by a municipality to help promote the proper participation in waste management and waste diversion programs.

Property value protection plan	Plan that addresses the potential effect of the landfill expansion on local property values.
Processing	Preparation of solid waste for sale to markets through such activities as hand sorting, magnetic and/or mechanical separation or shredding, composting, or digestion.
Procurement	The purchase of goods or services, usually by an organization or government. Procurement policies or regulations may establish requirements for purchasing goods that contain a minimum level of recycled content and/or are recyclable.
Putrescible waste	Waste containing readily degradable matter such as food or animal matter, including dead animals or animal parts, or unstable or untreated biosolids.
Pyolysis	The chemical decomposition of a substance by heat in the absence of oxygen, resulting in the production of various hydrocarbon gases and carbon-like residue.
Radiosonde	A miniature radio transmitter that is carried aloft (as by an unmanned balloon) with instruments for sensing and broadcasting atmospheric conditions.
Ramsar convention	Program which designates wetlands of international importance.
Receptor	The person, plant or wildlife species that may be affected due to exposure to a contaminant.
Recovery rate	Proportion of material recovered from the total waste stream.
Recyclables	Any material destined for recycling. In a curbside recycling program, includes materials such as: glass, metal food and beverage cans, aluminum foil, rigid shell plastic containers, newspaper, cardboard, fine paper, boxboard.
Recycling depot	A designated location within a municipality where recyclable material (Blue Box, organics, scrap metal, clean lumber, etc.) can be dropped off into segregated bins.
Release	Restoration of the land surface to a state appropriate for future use. Act of remediating may include: stabilization, contouring, conditioning, reconstruction and revegetation of the land surface.
Rendering	Processing of animal wastes at high temperatures to produce oil, fats, or animal feed.
Residential/Single family (SF) waste	Waste generated from single family households, considered a demographic group of residents spatially delimited physical structure.
Residual waste	Waste which cannot be reduced, reused or recycled further. It is also referred to as garbage, which must ultimately be disposed in a landfill site.

Restore the natural environment	When used with reference to a spill of a pollutant, means restored all forms of life, physical conditions, the natural environment and things existing immediately before the spill of the pollutant that are affected or that may reasonably be expected to be affected by the pollutant, and "restoration of the natural environment", when used with reference to a spill of a pollutant, has a corresponding meaning.
Reuse	The use of a product, such as a refillable beverage bottle, more than once, possibly with slight modification.
Risk management	The implementation of a strategy or measure(s) to control or reduce the level of risk that has been estimated by a risk assessment.
Rock	An aggregation of one or more naturally occurring minerals, typically two millimetres or larger in size.
Sanitary landfill	An engineered method of disposing off solid waste on land, in a manner that meets most of the standard specifications, including sound siting, extensive site preparation, proper leachate and gas management and monitoring, compaction, daily and final cover, complete access control, and recordkeeping.
Scrubber	An emission control device in an incinerator, used primarily to control acid gases, but also to remove some heavy metals.
Secondary leachate collection system	A leachate collection system located below the primary leachate collection system, intended as a back-up system.
Secondary liner	A liner located below the primary liner, intended as a back-up system.
Service area	The area from which a landfill site is allowed to accept waste materials for disposal or processing.
Service life	The period of time during which a properly maintained engineered facility will function and perform as designed.
Site life	The period of time during which the landfill can continue to accept wastes.
Site remediation	The treatment of a contaminated site by removing the contaminated solids/liquids or treating them onsite.
Site specific risk assessment (SSRA)	A scientific method used to examine the nature and magnitude of risks from the exposure of humans, plants and animals to contaminants in the environment at a specific site.
Soil	Unconsolidated particles smaller than 2 millimetres in size resulting from the breakdown of rock or organic matter by physical, chemical or biological processes, and includes foundry sand, and includes a mixture of soil and rock where fifty percent

or more by volume of the mixture is soil.

Source of contaminant	Anything that discharges a contaminant into the natural environment.
Source reduction (also waste reduction at source)	The conservation of materials and energy by preventing the formation of wastes such that no treatment, reuse, or disposal is required of excess or discarded materials. Source reduction is a subset of waste reduction.
Source separation	The separation of materials suitable for recycling or composting from solid waste at the source of generation (e.g., households, businesses).
Source separated organics (SSO)	This includes residential organic waste such as food waste and non-recyclable paper that is segregated for composting or other organic waste processing. Some municipalities have widened the definition of SSO to include diapers, sanitary products and pet waste.
Source separated recyclables (SSR)	A system whereby residents store recyclable parts of the waste stream in a separate bag, box or bin at home, so that it is relatively uncontaminated when dropped off at the recycling centre or picked up at the curb.
Special wastes	Wastes that are ideally considered to be outside the MSW stream, but sometimes enter it and must often be dealt with by municipal authorities. These include household hazardous waste, medical waste, construction, renovation and demolition debris, war and earthquake debris, tires, oils, wet batteries, sewage sludge, human excreta, stoichiometric condition slaughterhouse waste, and industrial waste.
Stakeholders	Individuals or groups with a key involvement and other interested parties.
Stewards	Businesses that produce or import products that are sold to consumers that include packaging and/or end of product life wastes.
Stewardship Ontario	The Industry Funding Organization (IFO) established to develop diversion programs for both the Blue Box and MHSW Programs.
Substance	Any solid, liquid or gas, or any combination of any of them.
Teratogenicity	The ability of a chemical to cause a change in the normal development process of an unborn organism, resulting in permanent alterations in the biochemical, physiological or anatomical functions of the organism.
Thermal treatment	Technologies that process waste using high temperatures to reduce the quantity of material requiring disposal, stabilize the material requiring disposal, and recover energy and potentially material resources.
Threshold	The concentration or dose of a chemical above which an adverse impact can be

expected to occur.

Total waste disposal volume	For a landfilling site, the maximum volume of waste, including the volume of any daily or intermediate cover materials, to be deposited at the site in the fill area.
Toxicity	The ability of a chemical to cause injury to humans or the environment. Acute toxicity occurs soon after exposure, while chronic reactions are experienced long after the exposure.
Transfer station	Facility where material is transferred from collection vehicles to larger trucks or rail cars for longer distance transport.
Trommel	A rotary cylindrical screen, typically at a downward angle, that separates the materials of different physical size. Trommel screens are used to separate mixed recyclables, municipal solid waste components, or to screen finished compost from window and aerated static pile systems.
Vectors and vermin	Disease-carrying organisms such as insects, rodents, birds (especially gulls and crows) and other harmful or nuisance species (e.g. bears).
Vermicomposting	Worms digest organic wastes.
Virgin materials	Any basic material for industrial processes that has not previously been used, for example, wood pulp trees, iron ore, crude oil, and bauxite.
Volatilization	The process by which a chemical converts from a liquid or solid phase into a gaseous phase and disperses into the air.
Waste	Includes ashes, garbage, refuse, domestic waste, industrial waste, or municipal refuse and such other materials as are designated in the regulations.
Waste audit	Exercise of determining the quantity and composition of waste which is disposed.
Waste composition	The various component materials of the waste stream, typically described as a percentage of the entire waste stream by weight.
Waste disposal site	<ul> <li>Includes:</li> <li>(a) any land upon, into, in or through which, or building or structure in which, waste is deposited, disposed of, handled, stored, transferred, treated or processed, and</li> <li>(b) any operation carried out or machinery or equipment used in connection with the depositing, disposal, handling, storage, transfer, treatment or processing referred to in clause (a).</li> </ul>
Waste diversion	The redirection of generated wastes away from disposal through reuse, recycling, or recovery. It does not include source reduction.

Waste diversion credits	Financial incentive provided by municipalities to encourage or to reward waste diversion based on tonnage diverted from the waste stream.
Waste Diversion Ontario (WDO)	A non-crown corporation created under the Waste Diversion Act (WDA) on June 27, 2002. WDO was established to develop, implement and operate waste diversion programs for a wide range of materials (Blue Box Waste, Used Tires, Used Oil Material, Waste Electrical and Electronic Equipment and Municipal Hazardous or Special Waste) under the WDA.
Waste diversion rate	Waste diversion rate is the percentage of waste diverted from landfill through means of diversion programs (Blue Box, composting, etc). Waste diversion rate is determined by dividing the total quantity of waste diverted by the total amount diverted and disposed.
Waste electrical and electronics equipment	Any broken or unwanted electrical or electronic appliances including computers, phones and other items that have reached the end of their usable life.
Waste exchange	System for transferring waste material from one company to another that can use it. For example, packaging foam received by one company can be transferred to a stuffed toy manufacturer for use as stuffing.
Waste fill area	In a landfill site, area receiving waste.
Waste fill zone	The three-dimensional zone receiving waste.
Waste generation rate	The amount waste generated by a person(s) on a daily basis, typically measured in tonnes per person per year.
Waste generator	The person, business, institutional facility or industry which created the waste.
Waste management system	Any facilities or equipment used in, and any operations carried out for, the management of waste including the collection, handling, transportation, storage, processing or disposal of waste, and may include one or more waste disposal sites.
Waste minimization	Measures or techniques, including plans and directives, that reduce the amount of wastes for disposal to the greatest degree practical. (Getting as close to zero waste as practical.) Methods to achieve minimization include source reduction, reuse, environmentally sound recycling, and recovery.
Waste recycling strategy	A Best Practice initiated by Waste Diversion Ontario and funded through the CIF to optimize Blue Box programs. It includes forecasting waste and recyclable material generation, planning how to optimize recycling of identified materials and implementing and monitoring a plan to improve overall Blue Box capture rates and performance.

Waste reduction	The decreasing to some extent of the waste stream, requiring disposal through source reduction, reuse, recycling, or recovery. It is often confused with the more limited "source reduction," which deals with policies and approaches only from the curbside on, not further upstream.
Waste stream	The waste output of a community, region, or facility. Total waste can be categorized into different waste stream components (e.g., wet organic waste, construction waste, household hazardous waste, or white goods).
Waste-to-energy (WTE) plant	A facility that uses solid waste materials (processed or raw) to produce energy. WTE plants include incinerators that produce steam (for district heating or industrial use), or generate electricity and also include facilities that convert landfill gas to electricity.
Waste transfer station/facility	A facility where waste is transferred from small collection trucks into larger waste hauling vehicles for transportation to a waste diversion, processing or disposal site.
Water	Surface water and ground water, or either of them.
Water surplus	The water surplus provides an estimate of the volume of water available from precipitation to infiltrate into the site and for surface runoff during a 12 month period.
Water table	A level below the earth's surface at which the ground becomes saturated with water.
Wet/Dry	The wet stream contains organics plus other wet materials that are typically sent to a composting facility. Dry contains all recyclables plus other dry materials. MRF facilities are designed to separate dry recyclables from residual materials which cannot be recycled or for which there are no or limited markets.
Wet/Dry collection	The separation of residential solid waste into at least two components for collection: wet wastes, which are organic and collected for composting; and dry wastes, which are sorted at a central facility where the recyclables are removed for further processing.
White goods	Refers to household appliances such as refrigerators, stoves, freezers, washers, dryers, dishwashers, dehumidifiers, water tanks, air-conditioning units, heat pumps.
Windrow composting	Composting process whereby piled organic material is placed in a series of rows, usually two metres deep. The rows are turned periodically for natural aeration.
Yard waste collection	The collection of leaves, brush, grass and other yard waste for composting.
Zero waste	The philosophy of taking a cradle-to-cradle approach to managing waste where "industry has to redesign products and processes to reduce waste before it is made, as well as designing products for greater reuse."

### NOTICE OF STUDY COMMENCEMENT TO PREPARE A WASTE MANAGEMENT MASTER PLAN FOR THE CITY OF PETERBOROUGH

#### THE STUDY

The City of Peterborough, through their consultant Cambium Environmental Inc. (Cambium), has initiated a study to prepare a Waste Management Master Plan. The current Waste Management Master Plan (WMMP) was completed in 1993 as a joint City/County of Peterborough plan. Considering the age of the current plan and that the County of Peterborough (County) has initiated a County-focused WMMP, the City of Peterborough (City) is seeking the development of a City-focused WMMP, which will have a progressive and cooperative approach for a sustainable system providing service over a long-term planning period.

The Study will review the current waste management system including the infrastructure, collections, and processing. The Study will identify the areas of the waste management system that are working, the areas that need improvement, and the areas that need to be added to or removed from the City's current operation. The Study is heavily dependent on public input and will require assistance from the residents to move forward. Any and all recommendations stemming from the Study will be presented to the public during open house meetings and all input will be incorporated to develop the capital and operating budget for waste management over the next twenty year period.

As previously stated, public consultation is key to the preparation process. Upon confirmation of the meeting dates, locations and times, notices will be posted.

The City of Peterborough website:

http://www.peterborough.ca/living/city\_services/waste\_management will be updated frequently to provide information on the current status of the Study.

#### COMMENTS

You are encouraged to provide comments on the Study. All comments received will be included in the Study. An online survey will be available through the City website for your immediate participation. Comments and information provided by you will assist the Project Team in finding solutions for the City and the waste management options available.

Please contact the undersigned if you have any questions, comments or wish to be added to the project mailing list.

Virginia A. Swinson, B. Sc., Waste Reduction Programs Coordinator City of Peterborough 500 George Street North, Peterborough, Ontario, K9H 3R9 Phone: (705) 742-7777 ext. 1725 Fax: (705) 876-4621 Email: vswinson@peterborough.ca Kelly Murphy, P. Eng. Senior Project Manager Cambium Environmental Inc. 52 Hunter Street East Peterborough, Ontario K9H 1G5 Phone: (705) 742-7900 ext. 226 Fax: (705) 742-7907 Email: kelly.murphy@cambium-env.com

NOTICE OF PUBLIC INFORMATION CENTRE FOR A WASTE MANAGEMENT MASTER PLAN STUDY FOR THE CITY OF PETERBOROUGH

The City of Peterborough has initiated a study to prepare a Waste Management Master Plan. The Study is reviewing the current waste management system, including the infrastructure, collections, and processing. It will identify the areas of the waste management system that are working, the areas that need improvement, and the areas that need to be added to or removed from the City's current operations.

### Public Information Centre #1

Public Library Auditorium - 345 Aylmer St. N.

Date: Thursday October 27th

Times: 2:00 p.m. – 3:30 p.m.

6:00 p.m. – 7:30 p.m.

Members of the Cambium Environmental Project Team and City Staff will be available to answer any questions and accept comments. Light refreshments will be provided.

An online survey is available through the City website, and attendees at the Public Information Centre may fill out a paper survey. All comments provided will be considered by the Project Team when evaluating options for the City's future waste management system.

Go to <u>http://www.peterborough.ca/wmstudy</u> to complete the on-line survey at any time during the study. This site will also be updated regularly to provide information on the status of the Study.

Please contact the undersigned if you have any questions, comments or wish to be added to the project mailing list.

Virginia A. Swinson, B. Sc., Waste Reduction Programs Coordinator City of Peterborough 500 George Street North, Peterborough, Ontario, K9H 3R9 Phone: (705) 742-7777 ext. 1725 Fax: (705) 876-4621 Email: vswinson@peterborough.ca Kelly Murphy, P. 10/28/201

# Waste Management Master Plan (WMMP)

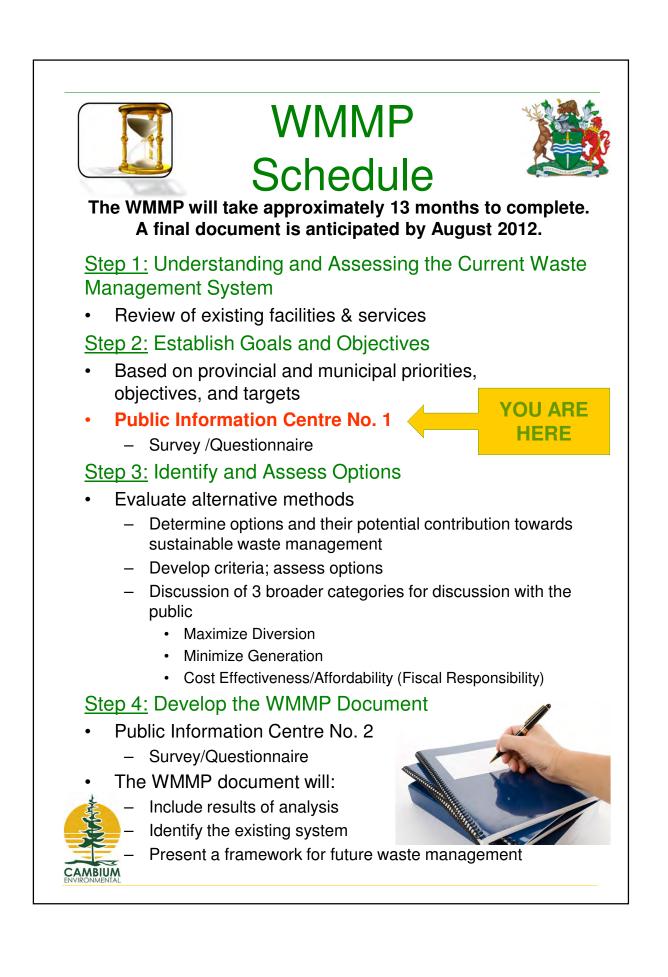

The WMMP will:

 Provide overall direction for the waste management system 10/28/201

- Address diversion and disposal needs for the next 20 years
  - Identify opportunities to improve the current system
  - Identify opportunities to reduce the amount of waste needing disposal

10/28/2011

# Waste Management Context

## **Description** of Waste Generation

- Population of 79,334
  - Unaccounted for student increase (September to May)
- Area of 1,283 km<sup>2</sup>
- 26,240 single family households
- 8,675 multi-family households
- Waste tonnage reported in 2010:
  - 34,683 tonnes of residential waste generated by City
  - 17,364 tonnes of this waste was diverted through diversion programs
  - 60,248 tonnes of waste entering the landfill (City and County combined)
- City waste diversion rate of 50%

## **Waste Management Facilities**

- 1 active landfill (City / County)
- Household Hazardous Waste Facility
  - Materials Recovery Facility

Composting Facility

## Key WMMP Considerations

- Decreasing remaining disposal capacity at Peterborough County/City Waste Management Facility (PCCWMF) landfill site
- Limited Monitoring and Reporting program in place to verify current capture and participation rates;
- There is currently no Source Separated Organics (SSO) program in place;
- Diminishing life capacity at the Material Recovery Facility (MRF) on Pido Road; and
- Limited influence/role with IC&I waste sector and waste management.

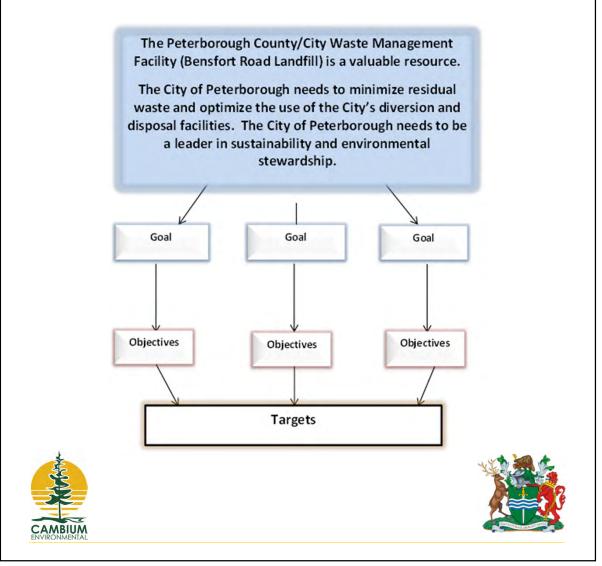

## Guiding Principle of the Plan

10/28/2011

The long-term Waste Management Master Plan (WMMP) is an essential step towards the provision of sustainable waste systems within the City of Peterborough. The WMMP begins with the establishment of a Guiding Principle, from which fundamental goals can be identified. Specific, achievable objectives are then set out, which will steer the City towards its intended targets.

The initial **Guiding Principle** of Peterborough's Waste Management Master Plan is as follows:

# **Goals and Objectives**

10/28/2011

### GOALS

The City's WMMP Steering Committee focused on three main areas for this WMMP, and set out three corresponding **goals**: to maximize the amount of residual material that we are able to divert from the landfill; to minimize the amount of residual material that is generated in the first place by the residents; and to operate and manage all of the City's required waste management systems in a fiscally responsible manner. The fundamental goals of the WMMP are as follows:

# Goals and Objectives

### **OBJECTIVES**

The fundamental goals will be achieved by setting more specific and measurable **objectives**. The City has established key objectives for each of these three goals:

 Maximize accessibility to City Waste Management programs and facilities
 Develop policies

surrounding waste reduction plans for businesses, events, and building/demolition permits

 Establish a curbside collection program for food waste, to be composted into a high value soil amendment

 Keep current with emerging waste diversion technologies Minimize Generation

 Encourage reuse facility development
 Establish working groups with local post-secondary institutions for new waste reduction and reuse programs
 Investigate corporate green procurement policies  Collaborate with surrounding municipalities on waste management opportunities where viable for the City and its residents
 Utilize waste management resources efficiently by reviewing and

Fiscally Responsible

10/28/2011

collaborating possible partnerships with

other groups or organizations

# Targets

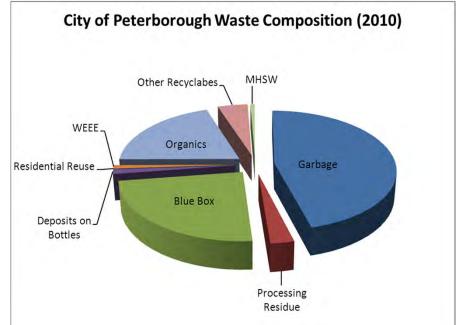

Key **TARGETS** have been generated from the goals and objectives that apply to all. These targets will allow the City to monitor their progress with the established Plan and verify deliverables. The targets will be adjustable with the changing economic and social trends and are provided as follows:

- 1.Expand the number and type of education and outreach and/or partnership activities year over year from 2010 levels.
- 2.Meet all 8 Waste Management Best Practices as outlined in the KPMG Blue Box Program Enhancement and Best Practices Assessment Project Report, 2007.
- 3.Residential diversion rate will increase from 2010 level of 50% to 75% over 20 years, with a review of target every five years.
- 4.Capture rates for blue box materials and green waste will increase 20% from 2006 levels over 20 years, with a review of target every five years.
- 5.Participate and continue to support producer responsibility awareness.

# City Residential Waste Composition

A total of 34,683 tonnes of residential waste was generated within the City limits in 2010

 Approximately 17,364 tonnes was diverted from landfill through programs such as blue box recycling, leaf and yard waste composting, MHSW collections, and backyard composting

# Waste Diversion

- Provincial target is 60%
- Current diversion rate 50%
- Diversion target of 75% by 2030 (to be reviewed every 5 years)
- Current diversion programs:
  - Weekly curbside blue box collection from 26,240 households
  - Seasonal curbside collection of leaf and yard waste
  - Bi-annual curbside collection of bulky items
  - Municipal Hazardous and Special Waste (MHSW)
  - Waste Electronics and Electrical Equipment (WEEE) or "used electronics"
  - Other (scrap metal, tires, appliances)
  - SSO Pilot Study
    - 625 single family households and 3 restaurants

RECYC

## Materials Recycling Facility (MRF)

- MRF was constructed by the City in 1989
- Located at 390 Pido Road
- Accepts all blue box materials from the City and the County
- Free disposal of blue box materials available 24/7
- The City and the County have separate long term agreements with the operator of the MRF (HGC Management Inc.)
  - Agreements expire December 31, 2014

## **City Composting Facility**

- Owned and operated by the City at Harper Road
- Accepts all leaf and yard waste collected in the City as well as SSO from Pilot Study
  - ~20% of residential waste by weight in 2010
- Offers compost for sale throughout Peterborough County
- Open windrow system mixes compost with wood chips

## How Does the City of Peterborough Stack Up?

REDUCE REUSE RECYCLE 10/28/2011

A waste audit was completed for the City in 2006, which illustrated the following:

- Participation rates:
  - Curbside garbage collection: 79% (2 bags per household)
  - Blue box program: 74%
- Average capture rate of blue box materials was 79.5%
  - Less than average of 85% for similarly sized municipalities
- The blue box program is better than average in cost efficiency (2010 Datacall)
  - ~\$147.75/tonne compared with ~\$222/tonne average
- The City disposes of slightly less waste than the average (2010 Datacall)
  - City residents dispose ~219 kg/capita compared with a ~268 kg/capita average

# **Options for Waste Reduction**

- Increase blue box items allowed
- Collect food waste at curbside
- User pay system
- Reduce bag allowance
- Clear garbage bags and contents monitoring
- City reuse centre
- Alter consumer choices to reduce packaging
- Increase Household Hazardous Waste Depot hours of operation

Reducing the amount of waste generated will help to conserve landfill capacity at the PCCWMF...

# Options for Future Waste Management

# The PCCWMF landfill has an estimated 12 to 15 years of capacity remaining

Options for future waste disposal include:

- Increase waste reduction (extend site life)
  - Accomplished through waste diversion initiatives and changes in consumer behaviour
- Landfill expansion or search for new site
- Export of waste
  - Waste could potentially be landfilled or treated thermally by others
- Thermal Treatment with potential for energy generation
  - An advanced technology that would allow energy to be recuperated from waste
- Other ideas? Tell us your thoughts.

# **Open House Session**

- Please help yourself to refreshments
- Please take a moment to complete a questionnaire (or take one home)
  - Questionnaire's can also be completed on the City website
- Please ask questions or provide your comments to meeting organizers

Thank you for attending and participating in the City of Peterborough Waste Management Master Plan Public Meeting No. 1.

## **Keep Informed**

Further information can be obtained on the City Waste Management Webpage:

### Open house held to gather input on city's waste management master plan

By KENNEDY GORDON, Examiner Staff Writer Updated 5 days ago

Dave Bucholtz is getting used to talking trash.

The environmental consultant spent the early part of the fall working on Peterborough County's waste management master plan — an ongoing effort — but was back at it Thursday night as part of the team tackling the city's garbage and recycling program.

"We're busy." said Bucholtz, who works for Cambrium Environmental.

Cambrium and the city held an open house Thursday night at the Peterborough Public Library, sharing the plan with the public and gathering input as the city's waste management master plan moves forward.

"We're here to get ideas," Bucholtz said.

The team, which includes city waste reduction program co-ordinator Virginia Swinson, will use the meeting to put together a draft plan that should be available by next spring.

"We're here to get ideas."

Dave Bucholtz, Cambrium Environmental

The session was wide open, meaning visitors could

share ideas, offer criticisms and make suggestions about waste management and recycling in the city.

"I'm curious what people will want to say," Swinson said. "Things have changed over the years and we have to move forward."

Wayne Jackson, the city's utility services director, was also on hand.

After touring the displays, participants were asked to fill out a survey about their waste management use and perceptions.

Swinson said educating the public remains key - many people continue to throw away things that can be recycled, and more can be done to reduce and reuse, she said.

The event attracted people who wanted to learn more and offer input.

"This might become part of my environmental studies course," said Trent University student Laurin Fulton as she filled out a survey.

The city is also offering the survey online at www.peterborough.ca/wmstudy.

This open house is the only one the city will hold, Bucholtz said.

The waste management master plan will result from a detailed study of city waste operations and look at improvements suggested by consultants, staff and the public.

"It's simply the case of getting good dollars for our materials. We've just had a banner year in terms of markets.

Virginia Swinson, waste diversion manager with the city

#### 9 million next year.

"We have commodities that we're selling.... Prices can be high or they can plummet," said Virginia Swinson, waste diversion manager with the city. "It's simply the case of getting good dollars for our materials.

"We've just had a banner year in terms of markets."

The city had planned to collect almost \$1.7 million from the sale of recyclable material this year, but now it estimates the final amount by the end of this year will be almost \$2.3 million.

Even with the added revenue this year, the city's net cost for recycling services would be about \$145,000 after about \$2.43 million in expenses.

If the city reaches its goal of a little more than \$1.9 million from the sale of recyclables next year, the net cost of recycling services would be \$554,363.

The city doesn't sell each type of recyclable material individually.

It sells the recyclable materials as a basket of goods at a flat rate based on a provincial average for the value of the different materials, Swinson explained.

"It works out to everyone's favour," she said. "It's a nice, easy and fair way of doing it."

The average price per tonne of recyclable materials was \$175 this year, \$124 in 2010 and \$80 in 2009, Swinson said.

In addition to the rising prices, the revenue has been buoyed by the increasing amount of materials being collected through the Blue Box program.

City's recycling efforts paying off with market prices for materials on the rise...

The amount of recyclable materials collected increased to an estimated 9,400 tonnes this year from 8,866 tonnes in 2008. It's projected to grow to about 9,450 tonnes next year.

The rising revenue from recyclable materials is helping the city offset declining revenue from less garbage being dumped at the county-city landfill.

The city's draft 2012 budget shows the city expects tipping fee revenue to decrease by \$521,750 next year compared to the amount the city budgeted to collect this year. The city and county share the revenue from tipping fees at the landfill, which means the cit/s share of the reduction would be \$260,875.

The city estimates 57,550 tonnes of garbage will be dumped at the landfill this year, down from 74,218 in 2007. It projects the landfill will receive 58,710 tonnes of waste next year, which would be the first increase after three consecutive years of less garbage going to the landfill.

It's difficult to determine why the amount of garbage going to the landfill is declining, Swinson said.

"It could be the economy," she said. "We believe that some waste is actually going outside of the community. Some of the larger haulers have transfer facilities.

About half of the garbage comes from municipal waste collection. The rest of the garbage, which is subject to tipping fees, comes from commercial haulers that collect garbage from large businesses and from individuals bringing their garbage to the landfill.

Less waste means less revenue from tipping fees. But there's also an upside for the municipality.

"Less material means the life of the landfill will be extended," Swinson said. "That's the good side of it."

### WMMP 2011

### 1. Do you currently live in the City of Peterborough?

Response Count	Response Percent	
188	89.5%	Yes
22	10.5%	No
210	answered question	
2	skipped question	

#### 2. What is your age? Response Response Percent Count 19-35 35.7% 66 36-50 34.6% 64 51-65 24.9% 46 65+ 4.9% 9 answered question 185 skipped question 27

3. What type of dwelling do	you reside in?		
		Response Percent	Response Count
Single-family home		79.3%	146
Multi-family dwelling (apartment, condominium, townhouses)		20.7%	38
		answered question	184
		skipped question	28

4. Indicate your residency i	n the city of Peterborough.	
	Response Percent	Response Count
Permanent	94.0%	173
Student	6.0%	11
	answered question	184
	skipped question	28

5. How many people normally live in your household?				
	Response Percent	Response Count		
1	9.8%	18		
2	40.8%	75		
3	16.3%	30		
4	21.2%	39		
5	7.6%	14		
More than 5	4.3%	8		
	answered question	184		
	skipped question	28		

6. What day is your waste, recycling and green waste collected?			
	Response Percent	Response Count	
Tuesday	33.2%	61	
Wednesday	15.8%	29	
Thursday	17.9%	33	
Friday	28.3%	52	
Not sure	2.2%	4	
Not applicable (reside in an apartment)	2.7%	5	
	answered question	184

Yard wastes		8.8%	10
Both		63.2%	72
		answered question	114
		skipped question	98

# 13. How satisfied are you with the current service levels for garbage, green waste and recycling? "1" being Very Unsatisfied, and "5" being Very Satisfied:

	1	2	3	4	5	Response Count
Garbage	1.7% (3)	4.4% (8)	6.7% (12)	28.9% (52)	58.3% (105)	180
Recycling	1.1% (2)	4.0% (7)	15.3% (27)	32.8% (58)	46.9% (83)	177
Green waste	17.5% (30)	12.9% (22)	12.3% (21)	19.3% (33)	38.0% (65)	171
				answe	ered question	180
				skip	ped question	32

14. If you chose "1" or "2" for any of the services in Question 13, please comment further on the reasons for your dissatisfaction.

	Response Count
	67
answered question	67
skipped question	145

## 15. How do you normally find information about the City's solid waste management services?

	Response Percent	Response Count
Waste Reduction Calendar	50.0%	87
Waste Management Brochures	18.4%	32
Newspaper ads	30.5%	53
Through friends and neighbours	18.4%	32
City website	48.3%	84
City council meetings	2.3%	4
	Other (please specify)	20
	answered question	174
	skipped question	38

16. Please indicate how often you use the City's existing waste management facilities, with "0" being Never, "1" being Annually, "2" being Seasonally, "3" being Monthly, "4" being Weekly, and "5" being Daily.

	0	1	2	3	4	5	Response Count
Landfill Site (Bensfort Road)	37.5% (66)	31.3% (55)	25.0% (44)	5.1% (9)	0.6% (1)	0.6% (1)	176
Household Hazardous Waste and Electronics Depot (Pido Road)	26.2% (45)	40.7% (70)	29.7% (51)	2.3% (4)	0.6% (1)	0.6% (1)	172
24-hour Recycling Drop-Off Depot (Pido Road)	44.1% (75)	21.8% (37)	25.3% (43)	7.1% (12)	1.2% (2)	0.6% (1)	170
					answere	d question	176
skipped question						36	

17. Please provide any comments you have on the current waste management services provided by the Clty today(garbage, green waste, blue box collections, Household Hazardous Waste and Electronics Depot, Landfill site).

	Response Count
	76
answered question	76
skipped question	136

## 18. The City's current rate of waste diversion (residential) is 50%. The provincial goal is 60%. What level of waste diversion would you like to see the Clty set as a goal?

	Response Percent	Response Count
Current level of 50%	6.0%	8
55%	6.0%	8
60%	20.3%	27
65%	67.7%	90
	Other (please specify)	49
	answered question	133
	skipped question	79

19. Please rate each of the following waste diversion options according to your preference, with "1" being highest preference and "5" being lowest preference.

	1	2	3	4	5	Response Count
Increase the items you can recycle in the blue box	50.3% (86)	22.8% (39)	10.5% (18)	5.8% (10)	10.5% (18)	171
Collect food waste at the curb for composting	57.5% (100)	8.6% (15)	7.5% (13)	5.2% (9)	21.3% (37)	174
Implement a User-Pay system for garbage	18.0% (30)	15.0% (25)	12.6% (21)	13.2% (22)	41.3% (69)	167
Mandate the use of clear bags for garbage	20.2% (34)	6.0% (10)	23.8% (40)	13.1% (22)	36.9% (62)	168
Reduce the number of bags of garbage permitted	24.8% (41)	15.2% (25)	15.8% (26)	10.3% (17)	33.9% (56)	165
Increase the Household Hazardous Waste Depot hours of operation	13.1% (21)	18.1% (29)	33.8% (54)	13.8% (22)	21.3% (34)	160
Municipal Reuse Centres	27.3% (44)	24.2% (39)	25.5% (41)	11.8% (19)	11.2% (18)	161
Increase the cost of landfilling	11.7% (19)	16.0% (26)	24.7% (40)	20.4% (33)	27.2% (44)	162
				answe	red question	175
				skip	ped question	37

### 20. What would you be willing to do personally to reduce your garbage generation?

	Response Percent	Response Count
No change	8.0%	14
Buy products with less packaging	70.7%	123
Only buy products in packages I can recycle	50.0%	87
Compost at home	48.9%	85
Participate in a curbside food waste collection	73.6%	128
Use reusables shopping bags	72.4%	126
	Other (please specify)	28
	answered question	174
	skipped question	38

## 21. Would you participate in a curbside food waste collection if it were offered in the City?

	Response Percent	Response Count
Yes	81.7%	143
No	10.9%	19
Not sure	7.4%	13
	answered question	175
	skipped question	37

## 22. Would you be in favour of biweekly garbage collection, if an enhanced recycling program and a new weekly food waste collection were implemented?

	Response Percent	Response Count
Yes	65.5%	114
No	24.7%	43
Not Sure	9.8%	17
	answered question	174
	skipped question	38

## 23. How would you describe your level of concern for the potential environmental impacts associated with landfilling garbage?

	Response Percent	Response Count
Very concerned	59.4%	104
Somewhat concerned	36.6%	64
No concerned at all	4.0%	7
	answered question	175
	skipped question	37

24. If you indicated a concern, which things concern you the most? Choose as many as apply.

		Response Percent	Response Count
Groundwater impacts		88.2%	142
Surface waste impacts		61.5%	99
Biological impacts		73.9%	119
Traffic impacts		8.7%	14
Litter and Debris		40.4%	65
Odours, air emissions		47.8%	77
Public Safety		25.5%	41
	Oth	er (please specify)	23
	а	nswered question	161
		skipped question	51

25. Please rate the following criteria for evaluating future waste management options from 1 to 7 (with "1" being the highest importance, "7" the lowest):

	1	2	3	4	5	6	7	Response Count
Postive social impact and acceptibility	9.0% (12)	27.6% (37)	12.7% (17)	14.2% (19)	11.2% (15)	5.2% (7)	20.1% (27)	134
Positive environmental effects	64.5% (91)	10.6% (15)	7.8% (11)	3.5% (5)	5.7% (8)	2.8% (4)	5.0% (7)	141
Proven technology	3.9% (5)	23.4% (30)	18.8% (24)	15.6% (20)	20.3% (26)	10.9% (14)	7.0% (9)	128
Cost/Affordability	10.8% (15)	19.4% (27)	24.5% (34)	17.3% (24)	10.1% (14)	7.9% (11)	10.1% (14)	139
Ease of implementation	4.3% (6)	8.7% (12)	16.7% (23)	19.6% (27)	19.6% (27)	21.7% (30)	9.4% (13)	138
Extent of local control	5.7% (8)	11.3% (16)	7.8% (11)	14.2% (20)	16.3% (23)	25.5% (36)	19.1% (27)	141
Scalability - can be expanded over time	10.4% (16)	8.4% (13)	16.2% (25)	14.3% (22)	13.6% (21)	16.9% (26)	20.1% (31)	154

### NOTICE OF PUBLIC INFORMATION CENTRE Waste Management Master Plan City of Peterborough

#### THE STUDY

The City of Peterborough, through their consultant Cambium Environmental Inc. (Cambium), has completed a draft of their 20-year Waste Management Master Plan (The Plan).

The Plan reviews the current waste management system, including waste infrastructure, collections, and processing, and makes recommendations on how to improve areas of the waste management system that focus on diversion.

#### **PUBLIC CONSULTATION**

Development of the Plan is heavily dependent on public input. Before the Plan is finalized, the City is seeking comments from residents of the City. Recommendations in the Plan will be presented during one final public presentation, and input received from members of the public will be incorporated into the final version of the Plan.

The final Public Information Centre (PIC) will be held in conjunction with the Green Expo Event, taking place at the Lansdowne Place Mall on Saturday October 20<sup>th</sup> from 9:30 a.m. to 6:00 p.m. Residents are encouraged to visit the City/Cambium booth, review the materials on display, and provide comments.

A copy of the draft Plan can be found on the City website. Comments may be sent at any time to one or both of the undersigned until Monday October  $22^{nd}$ , 2012.

http://www.peterborough.ca/wmstudy

Please contact the undersigned if you have any questions or comments.

#### www.peterborough.ca

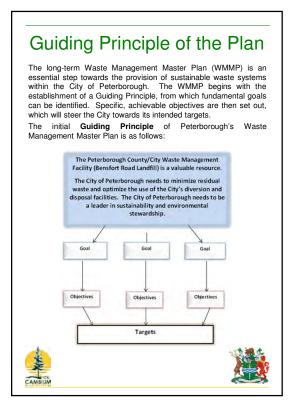

## Key WMMP **Considerations** Decreasing remaining disposal capacity at • Peterborough County/City Waste Management Facility (PCCWMF) landfill site Limited Monitoring and Reporting program in place to verify current capture and participation rates; There is currently no Source Separated Organics (SSO) program in place; Diminishing life capacity at the Material Recovery Facility (MRF) on Pido Road; and Limited influence/role with IC&I waste sector and waste management.

# Goals and Objectives

#### GOALS

The City's WMMP Steering Committee focused on three main areas for this WMMP, and set out three corresponding **goals**: to maximize the amount of residual material that we are able to divert from the landfill; to minimize the amount of residual material that is generated in the first place by the residents; and to operate and manage all of the City's required waste management systems in a fiscally responsible manner. The fundamental goals of the WMMP are as follows:

A total of 34,683 tonnes of residential waste was generated within the City limits in 2010

 Approximately 17,364 tonnes was diverted from landfill through programs such as blue box recycling, leaf and yard waste composting, MHSW collections, and backyard composting

## Waste Diversion

- Provincial target is 60%
- Current diversion rate 50%
- Diversion target of 75% by 2030 (to be reviewed every 5 years)
- · Current diversion programs:
  - Weekly curbside blue box collection from 26,240 households
  - Seasonal curbside collection of leaf and yard waste
  - Bi-annual curbside collection of bulky items
  - Municipal Hazardous and Special Waste (MHSW)
  - Waste Electronics and Electrical Equipment (WEEE) or "used electronics"
  - Other (scrap metal, tires, appliances)
  - SSO Pilot Study
    - 625 single family households and 3 restaurants

## Materials Recycling Facility (MRF)

- MRF was constructed by the City in 1989
- Located at 390 Pido Road
- Accepts all blue box materials from the City and the County
- Free disposal of blue box materials available 24/7
- The City and the County have separate long term agreements with the operator of the MRF (HGC Management Inc.)
  - Agreements expire December 31, 2014

### City Composting Facility

- Owned and operated by the City at Harper Road
- Accepts all leaf and yard waste collected in the City as well as SSO from Pilot Study

   ~20% of residential waste by weight in 2010
- Offers compost for sale throughout Peterborough County
- Open windrow system mixes compost with wood chips

#### Key Disposal Recommendations The PCCWMF landfill has an estimated 12 to 15 years of capacity remaining Investigate Suitable Options for Future • Landfill Capacity - Monitor existing landfill capacity, landfill expansions and potential greenfield locations over time to allow the widest selection of suitable options. Undertake a Formal Review of Waste Management Technologies - The City should monitor the progress of alternative technologies such as thermal treatment and AD facilities. The review should be focussed toward technologies that have been proven effective in the North American context. Reviews should be completed on a regular basis (every 3 to 5 years). Commence an EA Process

• Other ideas? Tell us your thoughts.

City of Peterborough Waste Management Master Plan Public Consultation Survey No. 2

The City of Peterborough is currently undergoing the development of a Waste Management Master Plan (WMMP) to review existing waste services and systems, and to develop plans for the next 20 years. The City appreciates any and all input residents will have into this process. Please complete and return this questionnaire using the contact information provided at the end of the survey. **Comments must be returned by October 22, 2012.** 

The City has finalized and posted the Draft version of the WMMP for all to review on the website and copies are available at this public meeting for review. The WMMP developed key recommendations to reduce, reuse, and recycle and divert materials away from landfill.

1. The following are the Key Recommendations from the City's Waste Management Plan to enhance diversion from landfill. Please choose three that you believe to be the most important.

Develop an organics collection program for residential and apartment buildings.	
If an organics collection program is implemented, reduce garbage pickup frequency to every two weeks and provide weekly recycling and organic pickup to reduce collection costs and encourage diversion.	
Enhance Promotion and Education programs to keep residents informed about what they can and cannot recycle, reuse and compost.	
Enhance City staff training to ensure they are aware of current regulations, technologies and market trends.	
Establish recycling options for materials currently going to landfill including carpets, mattresses, textiles (clothing, linens)	
Establish a Waste Exchange/Reuse Centre at the landfill.	
Develop enhanced Public Space Recycling Program to provide recycling opportunities in parks and City facilities.	
Undertake regular waste audits to ensure residents are understanding and participating in the recycling and organics programs.	

The County/City has approximately 12-15 years of landfill capacity remaining. The more material we can divert from our landfill, the longer its lifespan will be. However, a new home for our remaining garbage will eventually be needed. The key recommendation from the WMMP was to continue to investigate and explore the City's options in cooperation with the County and move forward with an Environmental Assessment (EA).

City of Peterborough Waste Management Master Plan

Public Consultation Survey No. 2

2. Please rank the following future waste disposal options by checking the box you feel is most appropriate for each (1 being most preferred; 7 being the least preferred).

- N-

Mos	Most preferred Preferred						
Waste Disposal Options	1	2	3	4	5	6	7
Increase amount of waste diversion – Reduce, Reuse, Recycle (and extend the life of existing landfill)							
Expansion of existing landfill on Bensfort Road (if approved)							
Establish a new landfill facility within the City/County							
Export waste outside City/County boundaries (landfill or incinerate)							
Use of Alternative Waste Derived Fuel Technologies (using waste for energy generation incl. incineration, gasification)

1	need to send (mail) her info on cat litter, waste, composting	Oct 23, 2012 10:21 AM
2	Energy from waste the only sensible alternative	Oct 23, 2012 10:10 AM
3	people need to have a relationship with their waste to really get the issue offer tours to the waste dump	Oct 20, 2012 3:24 PM
4	I am interested to know how I can help with sustainability in my community including the encouragement of native trees and shrubs.	Oct 20, 2012 2:56 PM
5	Develop city incentive programs to encourage waste stream reduction and reuse - such as biogas	Oct 20, 2012 2:18 PM
	Developing waste diversion programs is the way I believe that the City of Peterborough can most appropriately respond to high demands for waste disposal facilities. More appropriate systems for organics disposal ought to be foremost in developing a plan which not only reduces landfill materials, but improves community awareness. Examining programs like those offered in Nova Scotia can help Peterborough to develop an advanced approach to waste management.	Oct 20, 2012 1:44 PM
7	We cab only recycle so much. Still will be a need for responsible landfills. Incinerators are paper monsters and need a continual source of organic material with paper being the best. Would defeat paper diversion programs. Over packaging due to health unit regulations. Look at more efficient collection method. eg a combo truck which collect garbage on one side and recylables on the other. Smaller blue boxes for seniors who generate low volumes.	Oct 20, 2012 1:35 PM
8	We need organic recycling like Toronto. Government should enforce or pass a bill to re-use not recycle containers for juice, water etc. Make a deposit for return like beer bottles.	Oct 20, 2012 1:30 PM
9	I feel that education is the most effective way of reducing our global waste problems, but it has to start early so that it translates into a lifestyle. Leading by example is the only way to get people to take notice.	Oct 20, 2012 1:01 PM
10	We need to adopt a incinerator type of waste disposal system in Peterborough just as Japan has adopted it and other countries. Also, we need to abolish the use of polymer plastics and move to strictly bio-degradable plastics.	Oct 20, 2012 11:51 AM
11	I think the city and county need to sharpen their programs already in place at the current landfill sites. They need to be a little tougher on the mixed materials coming in.	Oct 20, 2012 11:04 AM
12	Peterborough is incredibly behind in its waste diversion efforts by not having organic waste pick up. Even small towns of 1200 have organic waste pick up. People new to the community have been incredibly surprised that there is no organic waste. We really need this now.	Oct 20, 2012 10;59 AM
13 <sub>.</sub>	Emulating the system that have in Nova Scotia would be great. The organics collection is key, with no plastic bags permitted. I would really like to see dog poo permitted in the organics in biodegradable bags.	Oct 20, 2012 10:56 AM

Appendix B Relevant Legislation

### FEDERAL LEGISLATION

Waste management is governed federally through the Canadian Environmental Protection Act (CEPA) and the Canadian Environmental Assessment Act (CEAA). The CEPA provides the legislative framework for the establishment of pollution prevention plans, identification of toxic substances, establishment of waste management facilities, import and export of waste, as well as to regulate the effects of government operations on and in relation to federal lands and aboriginal lands. The CEPA established the Environmental Registry as a means for the Canadian public to receive information on any waste management facility or system to be established or altered which requires public input and screening.

The Canadian Environmental Assessment Act (CEAA) applies to all projects where the Government of Canada has decision-making authority – whether as a proponent, land manager, source of funding, or regulator. All projects receive an appropriate degree of environmental assessment which ensures that the environmental effects of projects are carefully reviewed before federal authorities take action in connection with them so that projects do not cause significant adverse environmental effects.

### **CANADIAN ENVIRONMENTAL PROTECTION ACT**

The CEPA declaration is as follows:

"It is hereby declared that the protection of the environment is essential to the well-being of Canadians and that the primary purpose of this Act is to contribute to sustainable development through pollution prevention."

The CEPA provides the government of Canada with some, but not necessarily all, of the following duties:

- o facilitate the protection of the environment by the people of Canada;
- o establish nationally consistent standards of environmental quality;
- o provide information to the people of Canada on the state of the Canadian environment;
- apply knowledge, including traditional aboriginal knowledge, science and technology, to identify and resolve environmental problems;
- protect the environment, including its biological diversity, and human health, from the risk of any adverse effects of the use and release of toxic substances, pollutants and wastes;
- protect the environment, including its biological diversity, and human health, by ensuring the safe and effective use of biotechnology;
- endeavour to act expeditiously and diligently to assess whether existing substances or those new to Canada are toxic or capable of becoming toxic and assess the risk that such substances pose to the environment and human life and health;

- endeavour to act with regard to the intent of intergovernmental agreements and arrangements entered into for the purpose of achieving the highest level of environmental quality throughout Canada; and
- ensure, to the extent that is reasonably possible, that all areas of federal regulation for the protection of the environment and human health are addressed in a complementary manner in order to avoid duplication and to provide effective and comprehensive protection.

The CEPA established the Environmental Registry as a means for the Canadian public to receive information on any waste management facility or system to be established or altered which requires public input and screening.

## CANADIAN ENVIRONMENTAL ASSESSMENT ACT

The Canadian Environmental Assessment Act (CEAA) applies to projects where the Government of Canada has decision-making authority – whether as a proponent, land manager, source of funding or regulator. All projects receive an appropriate degree of environmental assessment which ensures that the environmental effects of projects are carefully reviewed before federal authorities take action in connection with them so that projects do not cause significant adverse environmental effects.

The degree of assessment depends largely on the scale and complexity of the likely effects of the project. The assessment ensures that development in Canada or on federal lands does not cause significant adverse environmental effects in areas surrounding the project and the assessment is also used to ensure that there is an opportunity for public participation in the environmental assessment process.

After nation-wide consultations, in June 1992 the CEAA was passed and the Act provided four (4) types of environmental assessments: screening (including class screenings), comprehensive study, mediation, and assessments by a review panel.

Through a **screening**, a responsible authority documents the environmental effects of a proposed project and determines ways to eliminate or minimize (mitigate) harmful effects through modifications to the project plan. Projects with known effects that can be easily mitigated may be assessed through a **class screening**. There are two types of class screenings: models used to streamline a screening; or replacement class screenings that are used instead of a project-specific assessment.

Large-scale and environmentally sensitive projects usually undergo a more intensive assessment called a **comprehensive study**, which includes mandatory opportunities for public participation. **Mediation** is a process in which the Minister of the Environment appoints an impartial mediator to assess a project and help interested parties resolve issues. This approach may be used when interested parties agree, are few in number, and consensus appears possible.

Assessments by a **review panel** appointed by the Minister of the Environment may be required when the environmental effects of a proposed project are uncertain or likely to be significant or when warranted by public

concerns. Review panels offer individuals and groups, with different points of view, a chance to present information and express concerns.

Projects undergoing a comprehensive study, a mediation or review panel, must include a consideration of alternative means of carrying out the project, as well as the project's purpose and effects on the sustainability of renewable resources. (Canadian Environmental Assessment Agency, 2011)

### **PROVINCIAL LEGISLATION**

### O. REG. 347 (GENERAL – WASTE MANAGEMENT)

O. Reg. 347 under the EPA is the primary regulation for controlling the handling, disposal, and management of hazardous and non-hazardous wastes within the Province of Ontario. Under Regulation 347, wastes are classified into categories that direct handing requirements and specify control measures for disposal facilities.

Standards for the location, maintenance, and operation of landfill sites are detailed in Section 11 of O. Reg. 347. Section 9 of the Regulation additionally states that the terms and conditions of the Certificate of Approval can, on a site specific basis, override the standards of the Regulation.

### O. REG. 101/94 (WASTE DIVERSION ACT)

O. Reg. 101/94 outlines municipal responsibilities with respect to blue box recycling systems in Ontario. These requirements pertain to collection methods/frequency, materials being recycled, promotion, and reporting.

The Waste Diversion Act (WDA) was passed into law on June 27, 2002. The purpose of the WDA is to promote the reduction, reuse, and recycling of waste in Ontario and to provide for the development, implementation, and operation of waste diversion programs. Under the WDA, programs have been established for blue box waste (under Ont. Reg. 273/02), tires, Waste Electrical and Electronic Equipment (WEEE), and Municipal Household or Special Waste (MHSW).

In June 2004, the MOE released "Ontario's 60% Waste Diversion Goal – A Discussion Paper". The Discussion Paper outlines achieving a target of 60% waste diversion from disposal by 2008. The MOE identified seventeen (17) potential action items that would assist the Province in achieving 60% diversion, if implemented. These options were subsequently discussed through a province-wide consultation process and an assessment of the costs and environmental impacts of each option considered. While the results of the consultation and assessment processes were never released publicly, it was the Province's intention that the discussion paper and its action items form the basis of policy decisions regarding Ontario's future waste management system.

No steps were taken by the Province to formally establish the 60% waste diversion target or any other mandatory diversion target for municipalities. However, many of the larger Ontario municipalities and those with leading waste diversion programs have moved to adopt the 60% diversion target for the residential waste stream that they

manage. While no municipalities have identified that they have successfully achieved this diversion target, several are proactively implementing diversion programs in order to meet this goal.

On June 12, 2007, the MOE released a proposed "Policy Statement on Waste Management Planning". The MOE posted the Policy Statement on the Environmental Registry for a 45 day public review and comment period. This Policy Statement outlines the requirement for municipalities with a population of less than 100,000 (i.e., City of Peterborough), to develop a municipal waste plan. A key aspect of the Policy Statement includes the requirement for municipalities to maximize diversion of materials from disposal, including a commitment to meet the provincial target of 60% diversion from waste disposal.

O. Reg. 101/94 makes it mandatory for municipalities with over 5,000 people to implement and operate a curbside recycling program (i.e., Blue Box program). The Blue Box program must allow for the source separation and collection of a core suite of materials for recycling and includes newsprint, paper, cardboard, steel, glass, aluminum, and PET food and beverage containers. This regulation also requires municipalities to provide a backyard composter program and leaf and yard waste collection and composting. The City currently provides these programs consistent with the regulation.

The City is currently meeting legislative requirements regarding diversion programming (i.e., blue box materials and recycling; tire, WEEE, MHSW diversion programs).

There are several proposed changes to waste management legislation that could potentially impact the City. In October 2008 the MOE began a review of the WDA. The purpose of the review was to investigate issues affecting waste diversion and to contemplate using the principles of Extended Producer Responsibility (EPR) as the basis for Ontario's waste diversion framework.

The potential impacts to the City can be described as follows and particularly as they relate to the possibility that producers could become fully responsible for waste diversion in the residential and IC&I sectors:

- potential loss of control of the recycling program;
- impact on infrastructure;
- disposal bans;
- disposal levies; and,
- program costs.

In April 2009, Waste Diversion Ontario (WDO) released a report entitled —Blue Box Program Plan Review Report and Recommendations. This review was requested by the Minister of the Environment on October 16, 2008. The Minister directed WDO to undertake the Blue Box Program Plan (BBPP) review using the principles of extended producer responsibility to form the review framework. The review resulted in 20 recommendations under each of

the ten (10) issues that were identified by the Minister of the Environment. Overall the review implications for the BBPP and Regulation 273/02 could affect the City's Blue Box program by requiring a change in the quantity, number, and type of materials accepted, requiring higher diversion targets, and ensuring environmentally responsible end-market destinations for recyclable materials. There may be the potential for increase funding which may offset any cost associated with implementing these changes. These potential legislative changes have been considered in the development of the City's WMMP.

#### Leaf & Yard Waste Management

O. Reg. 101/94 (Recycling and Composting of Municipal Waste) requires that municipalities that have a population of 5,000 shall establish, operate, and maintain a leaf and yard waste system. This system includes 'the provision of home composters to residents by the municipality at cost or less, the provision of information to residents, publicizing the availability of home composters, explaining the proper installation and use of home composters and the use of compost, and encouraging home composting.'

Municipalities with populations greater than 50,000 are also required to provide a leaf and yard waste collection system that is reasonably convenient to the generators of leaf and yard waste and that the waste must be either applied directly to land, transported to be applied directly to land, composted, or transported to be composted.

Burning of clean wood and brush is allowed at some member municipality landfills under conditions specified in their Certificates of Approval (C of A) in accordance with Ministry of the Environment Guideline C-7 (Burning at Landfill Sites - April 1994).

#### Industrial, Commercial and Institutional Wastes

There are currently two pieces of legislation which are applicable to IC&I waste. The first is O. Reg. 102/94 which requires certain IC&I facilities to conduct Waste Audits and produce Waste Reduction Work Plans. O. Reg. 103/94, Industrial, Commercial and Institutional Source Separation Programs, requires owners of the IC&I facilities identified in Reg. 102/94 to have source separation programs in place for certain wastes.

#### Source Separated Organics (SSO) Composting

Organic waste makes up approximately one-third of Ontario's waste stream and consists of:

- Leaf and yard waste;
- Household "green bin" waste;
- Food from restaurants, hotels, schools and hospitals;
- Residue from food processing operations and supermarkets; and
- Spoiled food;
- Sewage biosolids and septage; and

• Pulp and paper mill biosolids.

Currently there is no Provincial legislation banning food waste from landfill, or making composting of food waste mandatory and most organic waste in Ontario is sent for disposal in landfills or is land applied.

If a municipality chooses to implement curbside collection of Source Separated Organics (SSO), the central composting facility and testing of feedstock and resulting compost are currently regulated by the MOE's Interim Guidelines for the Production and use of Aerobic Compost in Ontario, November 2004.

The MOE is proposing to update the Interim Guidelines for the Production and Use of Aerobic Compost in Ontario (2004) to include the most up-to-date best management practices and standards. The MOE issued a proposed Guideline for Composting Facilities and Compost Use in Ontario dated November 2009 for consultation until January 2010.

The updated document will provide guidance on facility siting, design, equipment use and operating procedures, including feedstock control and odour prevention, would help minimize environmental impacts, such as odours, as well as improve the quality of finished compost.

It also introduces higher allowable feedstock metal levels and three categories of compost (Categories AA, A, and B). As mentioned in the Biosolids Management section, this proposed guideline creates an opportunity to cocompost food waste with biosolids if desired.

At the date of completion of this WMMP, a final decision or approval on the proposed Guideline had not been finalized by the MOE.

### O. REG. 101/07 (WASTE MANAGEMENT PROJECTS)

In March 2007, the MOE announced the enactment of O. Reg. 101/07 (Waste Management Projects) under the EAA and amendments to the EPA for waste recycling, mining, alternative fuels, and new/emerging technologies. The regulatory changes were created for the purpose of reducing the time and resources required under select circumstances for the approval of continued operations of small rural landfills through capacity expansions or landfill mining.

The new regulation establishes three classes of waste management projects. Those projects, both public and private, with the highest impact are designated for the full EAA process and include:

- A new Environmental Screening process applies to projects with predictable effects that can be "readily mitigated."
- Projects classified as having minimal impacts, such as landfill expansions to less than 40,000 cubic metres, do not require approval under the EAA and are not designated as subject to the requirements of the EAA.

- Recycling facilities of any size will not have to go through the EA process provided that less 1,000 tonnes per day of waste is disposed.
- Proponents can pilot new waste technologies without having to undergo an EA providing they are small and can meet the MOE's air emission standards. It may make it easier to recycle certain wastes that currently do not meet existing exemptions criteria such as waste paint, crumb rubber batteries, and electronics.
- Converting certain wastes into alternative fuels will no longer require waste management approvals but must still meet the MOE's air emission standards.

### O. REG. 267/03 (NUTRIENT MANAGEMENT ACT)

The Nutrient Management Act (NMA) and O. Reg. 267/03 (O. Reg. 267/03) made under that act, will impact waste management activities within the City because this legislation regulates nutrient use on agricultural land within the province. Some wastes (typically sewage sludge) that are routinely landfilled can also be land-applied as a nutrient source or soil amendment, subject to the conditions of the NMA and its Regulations. Similarly, some organic processing by-products from composting may be land-applied subject to regulation under the NMA.

Any nutrient containing materials of non-agricultural origin, including sewage biosolids that are spread on agricultural land are referred to as non-agricultural source materials (NASM). NASM land application standards and requirements are enforceable under the NMA and if an adverse effect occurs or may occur, the EPA or the Ontario Water Resources Act may also apply.

O. Reg. 267/03, which regulates NASM application to agricultural land, was updated September 18, 2009. Generators of NASM, such as wastewater treatment plants and food processing facilities, are regulated under the Environmental Protection Act and Regulation 347 until the nutrient material arrives at the farmer's gate where it becomes subject to the Nutrient Management Act, 2002 and O. Reg. 267/03.

Since land application of sewage biosolids and other NASMs to agricultural land is controlled provincially, it is possible for biosolids from one municipality to be spread on approved land in another municipality.

### **GUIDELINES FOR THE PRODUCTION OF AEROBIC COMPOST IN ONTARIO, 1991**

Requirements for composting are listed in the Ministry of the Environment's Interim Guidelines for the Production and use of Aerobic Compost in Ontario, dated 1991. Under these guidelines, the inclusion of biosolids has been difficult for municipalities to meet due to very restrictive metal levels for the compost feedstock. Any resulting compost including biosolids would be controlled just as strictly as the original biosolids.

The MOE issued a proposed Guideline for Composting Facilities and Compost Use in Ontario dated November 2009 for consultation until January 2010 which includes less stringent allowable feedstock metal levels and three categories of finished compost (Categories AA, A, and B). If this Guideline is finalized without changes, there is a

greater probability of co-composting biosolids if desired. Material characterization would be required to determine the acceptable level of dilution with low-metal feedstocks. Compost produced with biosolids has the potential of meeting the requirements of the middle category of compost, Category A, involving some labeling and usage restrictions. If the compost falls into Category B, its use would be controlled just as strictly as the original biosolids.

### **PROPERTY MAINTENANCE**

## Chapter 594 GARBAGE - COLLECTION

#### CHAPTER INDEX

#### Article 1 INTERPRETATION

- 594.1.1 City defined
- 594.1.2 Garbager container defined
- 594.1.3 Dwelling unit defined
- 594.1.4 Garbage defined
- 594.1.5 Garbage container defined
- 594.1.6 Green Waste defined
- 594.1.7 Green Waste Container defined
- 594.1.8 Lodging house defined
- 594.1.9 Occupant defined
- 594.1.10 Person defined
- 594.1.11 Recyclable material defined
- 594.1.12 Recyclable material container defined
- 594.1.13 Solid waste defined
- 594.1.14 Supervisor defined

#### Article 2 GENERAL PROVISIONS

- 594.2.1 Materials prohibited
- 594.2.2 Solid Waste for collection container required

- 594.2.3 Garbage containers maximum permissible
- 594.2.4 Garbage containers maximum permissible dwelling unit

594.2.5 Garbage containers – maximum permissible – lodginf house

- 594.2.6 Containers placement permissible locations
- 594.2.7 Containers removal after collection time
- 594.2.8 Containers placed for collection time
- 594.2.9 Scavenging prohibited
- 594.2.10 Collection private property conditions
- 594.2.11 Supervisor enforcement

#### Article 3 SEVERABILITY

594.3.1 Severability

#### Article 4 ENFORCEMENT

594.3.1 Fine – for contravention

-----

#### "CHAPTER 594 SOLID WASTE COLLECTION

#### Article 1 INTERPRETATION

#### 594.1.1 City - defined

"City" means The Corporation of the City of Peterborough.

#### 594.1.2 Garbage container - defined

"container" means a garbage container, a green waste container, or a recyclable material container.

#### 594.1.3 Dwelling unit - defined

"dwelling unit" has the same meaning as that in the Zoning By-law of the City.

#### 594.1.4 Garbage - defined

"garbage" means any dry waste other than green waste, recyclable material, building materials, automobile parts, hot, explosive or highly combustible material, hazardous waste as defined in Ontario Regulation 347, or waste resulting from industrial processes.

#### 594.1.5 Garbage container - defined

"garbage container" means

- (a) a galvanized metal or rigid plastic container with a maximum capacity of 120 litres, being larger at the top than at the bottom, having a handle and fitted lid, and not exceeding 23 kg., including contents;
- (b) a polyethylene plastic bag of 1.5 gauge minimum thickness, fastened at the top and not weighing in excess of 23 kg., including contents;" (95-102)
- (c) a securely tied compact parcel of cardboard which is not recyclable material, not exceeding 91 cm x 61 cm x 61 cm in dimension and 23 kg. in weight.

#### 594.1.6 Green waste - defined

"green waste" means any plant material such as tree branches, shrub trimmings, grass clippings, bedding plants, weeds, or leaves.

### 594.1.7 Green waste container - defined

"green waste container" means

- (a) a galvanized metal or rigid plastic container with a maximum capacity of 120 litres, being larger at the top than at the bottom, having a handle and fitted lid, and having two clearly identifiable labels attached defining the contents as "Green Waste" and not exceeding 23 kg., including contents;
- (b) a wet strength kraft paper bag without ties, having a minimum total wall thickness of 0.23 mm, a flat base when unfolded, and not exceeding 23 kg., including contents; (95-102)
- (c) an open, circular wooden basket with handles and tapered sides having a volume of 1 bushel, more or less, and not exceeding 23 kg., including contents; and
- (d) tree branches or shrub trimmings not greater than 50 mm in diameter, securely tied in a bundle with string or twine made from natural fibres, not exceeding 100 cm. x 60 cm x 60 cm in dimension and 23 kg. in weight.
- (e) a woven bag with drawstring or other closure, made entirely from biodegradable undyed natural fibre, and not exceeding 23 kg. including contents" (94-156)

#### 594.1.8 Lodging house - defined

"lodging house" has the same meaning as that in the City's Licensing By-law governing the licensing and regulation of lodging houses (Chapter 490, City of Peterborough Municipal Code).

#### 594.1.9 Occupant - defined

"occupant" means the person in possession of a building or unit, and includes an owner or tenant.

#### 594.1.10 Person - defined

"person" includes a corporation, partnership, or association.

## 594.1.11 Recyclable material - defined

"recyclable material" means any material designated by the City as being acceptable for collection by the City or its agent for the purpose of recovery. Without limiting the generality of the foregoing, it shall include newspaper, unwaxed corrugated cardboard, boxboard, magazines, household fine paper, soft cover books, aluminum foil, and containers made of metal, glass and plastics." (95-102)

~~~~~~

# 594.1.12 Recyclable material container - defined

"recyclable material container" means

- (a) a blue rigid plastic container without a lid having a suitable identification, being larger at the top than at the bottom and having a maximum height of 35 cm and a top dimension of 40 cm x 50 cm, and not exceeding 23 kg., including contents; and
- (b) a secure bundle of newspapers or corrugated cardboard not exceeding 60 cm x 30 cm x 20 cm in dimension and not exceeding 23 kg. in weight.

#### 594.1.13 Solid waste - defined

"solid waste" includes garbage, green waste and recyclable material.

#### 594.1.14 Supervisor - defined

"Supervisor" means a Supervisor of solid waste collection appointed by resolution of Council.

#### Article 2 GENERAL PROVISIONS

#### 594.2.1 Materials - prohibited

No person shall place out for collection any material which is not solid waste.

#### 594.2.2 Solid waste - for collection - container required

No person shall place solid waste out for collection except in a container.

## 594.2.3 Garbage containers - maximum permissible

Except as provided in Sections 594.2.4 and 594.2.5, not more than four (4) garbage containers will be collected from any building or unit on any collection date. (95-102)

## "594.2.4 Garbage containers - maximum permissible - dwelling unit

Not more than two (2) garbage containers will be collected from a dwelling unit on any collection day, excepting the collection day next following December 25 in each calendar year, when not more than four (4) garbage containers will be collected. (95-102)

## 594.2.5 Garbage containers - maximum permissible - lodging house

Not more than four (4) garbage containers will be collected from a lodging house licensed for less that ten (10) lodgers on any collection day, excepting the collection day next following December 25 in each calendar year, when not more than six (6) garbage containers will be collected.

-----

--- -----

ĝ

# 594.2.6 Containers - placement - permissible locations

Containers shall be placed separately by the occupant in front of his or her building or unit, just off the travelled portion of the street so as not to interfere with traffic, or at any other convenient location as may be approved by a Supervisor.

## 594.2.7 Containers - removal after collection - time

Any container not collected shall be removed by the occupant by 8 o'clock in the afternoon of the day of collection.

# 594.2.8 Containers - placed for collection - times

Containers shall be placed out for collection by the occupant not later than 7 o'clock in the forenoon of the day of collection and not earlier than 6 o'clock in the afternoon of the previous day.

## 594.2.9 Scavenging - prohibited

594.2.11

No person, other than the occupant, or the City or its agent, shall remove the contents of any container placed out for collection pursuant to the provisions of this Chapter.

# 594.2.10 Collection - private property - conditions

Notwithstanding anything else contained in this Chapter, the City, or its agent, may, under conditions satisfactory to the City Engineer and the City Solicitor respecting access, container locations, and the execution of an indemnification agreement, enter upon private property for the purpose of collecting garbage, green waste or recyclable material.

## 594.2.11 Supervisor - enforcement

Every Supervisor shall have the authority to enforce the provisions of this Chapter.

#### Article 3 SEVERABILITY

#### 594.3.1 Severability

-----

If any section of this Chapter may be bound by any court of law to be illegal or beyond the power of Council to enact, such section shall be deemed to be severable and all other sections of this Chapter shall be deemed to be separate and independent therefrom

#~ . .

### Article 4 ENFORCEMENT

## 594.3.1 Fine - for contravention

Any person who contravenes this Chapter is guilty of an offence and shall be liable upon conviction to a fine imposed by law, and the same shall be recoverable pursuant to the <u>Provincial Offences Act</u>." (94-54)

### THE CORPORATION OF THE CITY OF PETERBOROUGH

#### BY-LAW NUMBER 07-027 AS AMENDED BY BY-LAW 09-108

(note: all amendments are in bold and underlined)

### BEING A BYLAW FOR THE PURPOSE OF REGULATING THE DISPOSAL OF WASTE, INCLUDING ESTABLISHING OF TIPPING FEES FOR THE PETERBOROUGH COUNTY-CITY WASTE MANAGEMENT FACILITY

**WHEREAS** Council of the City of Peterborough wishes to enact a By-law for the purposes of regulating the disposal of waste;

**AND WHEREAS** Section 391 of the *Municipal Act, 2001* provides that a municipality may pass by-laws imposing fees or charges;

**AND WHEREAS** solid waste tipping fees will be included in the By-law;

**AND WHEREAS** the City of Peterborough held a public meeting on December 11, 2006 at City Hall, 500 George Street North, Peterborough, in accordance with Regulation 244/02 under the *Municipal Act, 2001*;

**NOW THEREFORE** the Council of the City of Peterborough enacts as follows:

#### 1. INTERPRETATION

In this By-law:

"City" means the City of Peterborough;

"Director" means the Director of Utility Services for the City of Peterborough and where applicable includes a person designated by the Director to perform a task or exercise a power in his or her place and stead;

"garbage" means dry waste other than recyclable materials, organic materials and hazardous waste;

"green waste" has the meaning set out in Schedule "A";

"hazardous waste" means hazardous waste as defined in R.R.O. 1990, Regulation 347, as amended from time to time, pursuant to the Environmental Protection Action, R.S.O 1990, cE19, which includes:

- a) hazardous industrial waste;
- b) acute hazardous waste chemical;
- c) hazardous waste chemical;
- d) severely toxic waste;
- e) ignitable waste;
- f) corrosive waste;
- g) reactive waste;
- radioactive waste, except radioisotope wastes disposed of in a landfilling site in accordance with the written instructions of the Atomic Energy Control Board or the Canadian Nuclear Safety Commission;
- i) pathological waste;
- j) leachate toxic waste;
- PCB waste as defined in Regulation of 362 of Revised Regulations of Ontario, 1990;

"recyclable materials" means those materials set out in Schedule "A";

"waste" means anything for which the holder has no further use and which the holder has discarded and includes, but is not limited to garbage and recyclable material; "waste management facility" means the Peterborough County/City Waste Management Facility, formerly known as Bensfort Landfill Site, located at 1260 Bensfort Road, Township of Otonabee, South Monaghan, County of Peterborough. For the purpose of this by-law, the waste management facility includes the landfill site and the Public Drop-off Depot.

### 2. GENERAL PROVISIONS AND PROHIBITIONS

- 2.1 No person shall, at the waste management facility:
  - (a) deposit waste outside the posted hours of operation;
  - (b) deposit waste or recyclable materials at any place other than the place respectively designated for the receipt of such waste;
  - (c) deposit hazardous waste;
  - (d) deposit any waste which originated from outside the County or City of Peterborough. If requested, the person shall provide proof of the origin of the waste prior to depositing the waste;
  - (e) refuse to remove, at the person's expense, any waste which has been deposited by the person which is not in compliance with this by-law;
  - (f) remove or scavenge any deposited waste without the prior written approval of the Director;
  - (g) deposit waste which has been transported to the facility except when such waste has been properly secured or covered in canvas, tarpaulins or nets, so fastened down around the edges as to prevent any of the contents from leaving the vehicle during transport.
- 2.2 Not withstanding Section 2.1 (b), any load which contains less than 10% by volume of recyclable materials may be deposited at the place designated for the receipt of garbage.

### 3. **FEES**

- 3.1 No person shall deposit waste at the waste management facility without paying the appropriate fee for that type of waste, as set out in Schedule "B".
- 3.2 If any cheque provided in payment of a fee payable under Subsection 3.1 is returned marked "Not Sufficient Funds", the amount of the fee shall remain unpaid, and together with the administrative charge for NSF cheques, determined in accordance with the City's Financial Policies shall be a debt to the City owing by that person recoverable by action or other means open to the City.

### 4. ENFORCEMENT PROCEDURES

- 4.1 In the event that a person deposits, or attempts to deposit waste, not in compliance with this by-law:
  - (a) The person may be refused access to the waste management facility;
  - (b) The person shall receive a written warning on the first such occasion;
  - (c) The person shall pay surcharges in the following amounts on any subsequent occasions:

- (i) \$100 on the first subsequent occasion;
- (ii) \$200 on the second subsequent occasion;
- (iii) \$300 on the third and any other subsequent occasions.

### 5. SCHEDULES

The following Schedules attached hereto form a part of this By-law:

Schedule "A" – Recyclable Materials; and

Schedule "B" – Waste Management Tipping Fees.

#### 6. **PENALTY**

Any person who contravenes this by-law is guilty of an offence and, upon conviction, is liable to a fine or penalty provided for in the *Provincial Offences Act*, as amended.

### 7. EFFECTIVE DATE

This <u>amended</u> By-law shall come into force and take effect on <u>Tuesday</u>, <u>September 1, 2009</u>.

By-law 07-027 read a first, second and third time this 26<sup>th</sup> day of February, 2009. By-law 09-108 read a first, second and third time this 10<sup>th</sup> day of August, 2009.

## SCHEDULE "A"

### TO BY-LAW 07-027 RECYCLABLE MATERIALS

The following materials are banned from disposal at the waste management facility but are accepted for recycling at the facility's Public Drop-off Depot:

"blue box materials" means recyclable materials as collected in the City of Peterborough Blue Box Collection program, as amended from time to time, namely:

- a) clear and coloured glass from food & beverage bottles and jars; aseptic containers;
- b) metal cans and foil; including food & beverage cans, aluminum foil & trays;
- c) empty metal paint and aerosol cans;
- d) gable top drink cartons and tetra paks including milk and juice cartons and tetra pack containers for juice, milk, soup;
- e) plastic soft drink and water containers made out of polyethylene terephthalate (PET or PETE #1);
- f) plastic bottles and jugs made out of high density polyethylene (HDPE #2);
- g) tubs and lids (#5);
- h) polystyrene and styrofoam containers (#6) including clear trays abd clamshells marked with the #6 only; plant pots up to 12 inches in size, cell-paks, carrying flats; foam meat trays, plates, cups, take-out containers and egg cartons only;
- i) film plastic bags including bread, milk, fresh and frozen produce bags, bulk food, dry cleaning, toilet-tissue packaging, and cereal box liners;
- j) boxboard, including cereal, crackers, detergent, toothpaste, shoe boxes;
- k) corrugated cardboard consisting of triple-layer cardboard boxes. Waxed, stained, painted or contaminated cardboard must be discarded as garbage;
- I) paper including envelopes, direct mail advertising, paper egg cartons, greeting cards and all remaining paper and paper products generated by households
- m) newspapers & magazines, including inserts, catalogues, white envelopes, computer paper; writing papers, telephone directories, manuals & softcover books;

"clean wood waste" includes untreated lumber and wood products such as pallets and raw lumber, but does not include painted wood, paneling, pressboard or similar treated products;

"drywall" includes drywall scraps or drywall material, which may contain paint and screws, segregated from supporting building material;

"green waste" means leaves, grass clippings; trees, excluding stumps; garden roots and cuttings; hedge and shrub trimmings; brush cuttings; twigs and branches; natural Christmas trees; other plant material;

"scrap metal" includes metal auto parts, large appliances, bicycles, tools, etc; and

"tires" means tires without wheel rims.

### DISCLAIMER

This report was prepared for the Ontario Ministry of the Environment as part of a ministryfunded project. The views and ideas expressed in this report are those of the author and do not necessarily reflect the views and policies of the Ministry of the Environment, nor does mention of trade names or commercial products constitute endorsements or recommendation for use.

#### INFORMATION FOR THE READER

The results of the work will appear in three volumes.

Volume I contains the results of the residential portion of the Ontario Waste Composition Study and are presented herein. The emphasis in Volume I is on the development and testing of a method that municipalities can use to estimate per capita generation rates of residential refuse.

The following kinds of information on municipal waste are also included in Volume I: inorganic chemical analyses of vacuum cleaner bag dust (Town of Fergus and Borough of East York); moisture content of combustible materials separated from residential refuse (Town of Fergus and Borough of East York); BTU content of several mixed plastic wastes; waste composition and per capita generation rates of several schools (Borough of East York); and a survey of disposal of white goods and bulky items in several Ontario municipalities.

Volume II will report the results of the Commercial Waste Composition Study.

Volume III will be a " user friendly " manual that will outline the procedures for conducting residential and commercial waste composition studies in municipalities of Ontario.

#### ABSTRACT

Volume I, The Residential Waste Composition Study, is the first of three volumes representing the Ontario Waste Composition Study.

The Residential Study focuses on developing a cost effective method for carrying out a waste composition analysis. This method facilitates the collection of waste composition data and per capita waste generation data.

The Residential Waste Composition Study took place in the following municipalities. The Town of Fergus (population 6,757) between July 15 and August 31, 1989; The Borough of East York (population 101,085) between October 24 and December 28, 1989; and The City of North Bay (population 51,313) from February 21 - 28, 1990.

The method used in the study is based on the hypothesis that the characteristics of a residential waste stream are related to the socioeconomic lifestyles of people and the demographic characteristics of a municipality.

Statistics Canada information about the population of a municipality provides subunits of the population, known as Enumeration Areas (EAs). Each EA on average contains 600 people. Using the most recent Statistics Canada Census data each EA of the studied Municipalities were stratified according to income level (high, medium, or low). Within every income category each EA was further classified according to housing type. Statistics Canada reports on the number of single detached, apartments and other residences for each EA. From the income and housing type information, an income/housing sample matrix table was designed, defining the EAs to be sampled.

Based on a random numbering sample selection procedure for residential dwellings of a defined EA, the study team followed a sampling program in which refuse was collected, sorted into various waste composition categories (i.e.

(ii)

papers, plastics etc.), and weighed. Although the sampling method may vary based on housing type, in general, ten 100 kg. samples (minimum weight) were collected per day. Blue Box materials and yard waste, if present, were also collected but weighed separately. Total weights of refuse samples were measured for per capita waste generation data. White goods and bulky waste were also analyzed within the scope of the study.

The Residential Study demonstrated a cost effective waste composition and generation rate procedure that uses readily available equipment and that can be implemented by municipal staff.

#### EXECUTIVE SUMMARY

The two-fold purpose of the residential portion of the Ontario Waste Composition Study was to:

- develop a simple, cost effective and statistically reliable method for determining the composition and per capita generation rate of waste from residential sources in Ontario municipalities; and
- 2. apply the method in several municipalities and obtain current information on the characteristics of residential waste streams.

On the strength of a pre-study literature survey, summarized herein, it became apparent that residential waste generation was a function of the socio-economic and demographic characteristics of a population. Indeed, any assessment of the residential waste generation characteristics of a municipality should take population demographics into consideration.

While the number of socio-economic and demographic parameters that one could incorporate in a study of residential waste generation is very large, time and budget dictated that the parameters in the present study should be restricted to two principal parameters: income level and housing type. Statistics Canada provides census data with respect to these parameters for municipalities across the country and this kind of information was obtained for the three municipalities participating in the waste composition study in Ontario: the Town of Fergus (population: 6,757); the Borough of East York (population: 101,085); and the City of North Bay (population 51,313). The field studies were conducted in the three municipalities during the following periods: July 15 to August 31, 1989; October 24 to December 28, 1989; and February 21 to February 28, 1990 respectively.

Statistics Canada provides socio-economic and demographic information on small geographical sectors of municipalities called Enumeration Areas (EAs) that typically have a residential population of 600-800 persons. Some apartment

buildings may have a large enough number of units that they are designated as EAs unto themselves.

In the work reported herein, the EA was the basic population unit whose waste composition and per capita generation rates were studied as representative segments of the entire municipal population. First, all of the EAs in the municipality were classified in a three-by-three, two dimensional matrix of:

<u>Average annual income</u>: high, medium, and low; and <u>Housing type</u>: single detached dwellings, predominantly multiple dwellings (apts.), and predominantly mixed (detached apts.).

This classification matrix resulted in nine possible combinations of income levels and housing types with each combination termed a "cell". One EA was randomly selected from each cell, unless the cell contained few or no EAs, which was often the case for the low income detached dwelling cell. The residential waste assessments in the Town of Fergus and the Borough of East York were based on data from EAs that were representative of the EA distribution in the income/housing matrix for the respective municipalities. Based on the results of these two municipalities, it was decided to conduct a reduced sampling program in the City of North Bay.

After the Study EAs in the municipality were randomly selected, a curbside refuse sampling plan was designed, based on a procedure that assigned random starting points for refuse collections at street intersections throughout the EA. For each EA, both the number and weight of the refuse samples that had to be collected and sorted in order to obtain the statistical accuracy that we wanted to achieve for the kitchen waste fraction (only) of residential waste was based on the pioneering work of Dr. A. Klee and co-workers. The sample number was nine per EA and the minimum sample weight was 100 kg. To achieve similar levels of statistical accuracy for waste components occurring at lower concentrations in the waste stream (for example, glass and ferrous

metals), a greater number of samples, which may be economically impractical, would be required.

It took a crew of four, approximately 5.5 days to collect and sort the bagged refuse and Blue Box materials in a single EA. Records were kept of the number of dwellings from which bagged refuse and Blue Box materials were collected in order to compute estimates of total residential waste generation on a per capita basis, using Statistics Canada data on the average population per dwelling in the EA. Blue Box materials were sorted, weighed and recorded separately in order to estimate the capture rate of certain recyclable items from the residential waste stream.,

Yard wastes were weighed and recorded whenever they were encountered, but this waste stream was not included in the computations of the residential waste composition and the weight was not included in the estimates of per capita generation rates either, for seasonal generation reasons discussed herein.

The moisture content of the combustible fractions of the waste stream was determined by drying. The BTU content of some mixed plastics (laminates), as well as disposable diapers, was determined by bomb calorimetry. Samples of vacuum cleaner bag dust were analyzed for heavy metals.

Special sampling procedures were devised for those apartment buildings where the waste was compacted in containers. Samples of the required weight were removed from the containers for the waste composition analysis. Then the residual contents were collected and weighed, courtesy of special arrangements made with a local waste hauler and transfer station scale house.

The weekly waste streams for seven schools in East York were also collected and the waste composition was determined. Per capita generation rates for the student body and total staff were computed.

(xiv)

A survey was also conducted to assess the yearly tonnages of white goods and other bulky items generated by residential areas in 10 municipalities in Ontario.

The methods developed and used in this study were found to be cost effective and capable of being used by municipal staff. Recommendations are presented to further refine and improve the methods used.

Ontario municipalities are encouraged to use the methods demonstrated in this study to satisfy municipal needs, to generate further data on a consistent province-wide basis and to assist in assessing the effectiveness of new waste management programs and identifying trends in waste composition and generation rates.

#### Conclusions:

The results of the residential waste study presented herein lead to the following conclusions.

1) Municipalities in Ontario are implementing a number of waste diversion options for residents -- notably, Blue Box and backyard composting -- as the waste management strategies of municipalities continue to change. As the number of waste diversion options increase, the chances of obtaining an accurate baseline of waste generation data decreases. Where there was formerly a single waste stream coming from residences on a predictable and scheduled basis, now there may be two or more curbside waste streams, and possibly another stream directed to a backyard composter. Therefore, there is more potential for error in waste composition studies conducted in municipalities that are aggressively pursuing waste diversion programs (e.g. Fergus and East York) than in those that have yet to implement such programs --- and where there is still a single residential waste stream.

- 2) Given an understanding of the <u>reality</u> of residential waste stream partitioning noted above, the residential waste assessment procedures for detached dwellings included an estimated allocation for Blue Box materials. Waste assessment of residential populations residing in multi-unit dwellings (apartments) presented additional challenges in data collection. Per capita waste generation rates were obtained for both residential groups; however, a need for improvement in sampling procedures was identified for large apartment buildings (East York) where refuse was compacted.
- 3) The per capita waste generation rates (excluding yard wastes and bulky items) for the three municipalities appeared to vary with population: Fergus 0.80 kg/capita/day; North Bay 0.93 kg/capita/day; East York 0.99 kg/capita/day. However, municipal population per se is probably only a superficial correlate and not causally related to the waste generation process. For example, the weight (kg) of the newspapers collected in East York, versus Fergus, may partially explain the higher per capita generation rate (kg person/day) in East York (Table 14). Some of the difference may also be attributed to seasonal factors.
- 4) The method used in the Study has revealed apparent differences in the per capita waste generation rates within income groups. More waste (excluding yard waste and bulky waste) appears to be generated by residents of detached dwellings than by apartment dwellers (Table 22). However, no easily discernable pattern could be detected in the per capita generation rates between different income groups. More detailed sampling in each municipality would be needed to determine any potential income effects on waste generation characteristics.
- 5) It is interesting to note that there is very little difference in average per capita generation rates of kitchen waste for Fergus, North Bay and East York. The respective values are: 0.23, 0.24 and 0.25 kg. capita day (Table 22).

(xvi)

When the kitchen waste fractions were computed as a percent of the total composition of the residential waste stream, Fergus showed a higher percentage than East York and North Bay: Fergus 28.8 % versus, East York 25.5 % and North Bay 26.0 %. Again, larger quantities of other components in the East York and North Bay residential waste streams (e.g. newspapers) may explain the lower percentage (or relative proportion) of kitchen waste in the refuse.

- (6) Reliance on "waste composition percent" as the sole means of characterizing waste can be misleading and create more questions than are actually answered. The per capita generation rates of the total waste stream and its components are more important for planners of municipal waste management programs.
- 7) The study demonstrates a cost effective residential waste assessment method that uses readily available equipment and that can be implemented by municipal staff.

#### **Recommendations:**

Municipalities conducting a waste composition study might consider the following recommendations when designing the sampling protocol and implementing the study methodology.

For sampling and sorting convenience, municipalities may choose to conduct the waste composition studies in late spring or mid fall when refuse odours are less intense and maggots are less frequently encountered. According to Vesilind & Rimer (ref. 47), the average residential waste composition does not vary by more than ± 10% over three quarters of the year. Therefore, aesthetics of the working conditions can be taken into account without risk of obtaining skewed data. The inclusion of yard waste in overall residential waste composition percent profiles should be avoided so that baseline composition percentages are not misrepresented.

- 2) Municipalities may choose to set up independent collection systems to study the seasonal generation of yard waste and leaves. This would require a coordinated effort between garbage collection personnel, private horticultural firms and other agencies generating and collecting these waste streams.
- 3) In order to avoid the sampling problems that we encountered with the large apartment buildings in East York, where apparent sampling biases were difficult to avoid, arrangements could be made, for example, with 30 units within the building to participate in a refuse study. This would give a more accurate appraisal of the waste composition in these large apartment buildings. As a check, the method described herein for obtaining the per capita generation rate for the entire building could then be compared with the per capita generation rate for the 30 units.
- 4) Municipalities in Ontario should follow the waste composition procedure in conducting their own waste composition analysis, for reasons of consistent data generation using a cost effective approach. Periodically, municipalities should conduct additional waste composition studies to monitor trends in residential waste management and the effectiveness of waste management programs.

SECTION 1

PREFACE AND BACKGROUND LITERATURE

#### 1.0 PREFACE & BACKGROUND LITERATURE

#### 1.1 Preface

With a view to OUR COMMON FUTURE (ref. 49) and a framework for a sustainable lifestyle, the by-products of industrialized nations must be responsibly managed. The Ontario Ministry of the Environment set two targets for the diversion of solid wastes going to landfill sites in the Province: a 25% diversion by 1992 and a 50% diversion from disposal by the end of the century. The methods that may be used to achieve these goals involve the "3-Rs": Reduce, Reuse and Recycle, and include composting but exclude incineration. Landfill crises are at hand in some Regional and area municipalities in Ontario and many waste disposal sites are close to their capacity. Similarly, in the United States, where 30% of the country's landfill sites will be filled and closed within 5 years, the United States Environmental Protection Agency has initiated an "Agenda for Action" (ref. 46). This program also encourages a maximum effort to divert wastes by prudent implementation of "3R-s" programs.

The development of plans to divert materials from landfill sites requires knowledge of the qualitative and quantitative composition of solid waste streams from residential, commercial and industrial wastesheds. The design of materials recovery facilities and centralized composting facilities that will receive, process and store (short term) components in the waste stream, must be scaled to the per capita waste generation rate of the wasteshed population served by the facilities.

The Ontario Ministry of the Environment contracted Gore & Storrie Limited, in association with Decima Research Limited, to develop quantitative methods that could be used by any municipality in Ontario to assess solid waste generation. The results of the residential portion of the Ontario Waste Composition Study are presented herein.

1-1

The residential report is divided into two main parts. The first part reviews the relevant literature (Canadian and non-Canadian) on the following topics: residential waste composition, per capita waste generation rates, some of the methods that have been used in earlier waste composition studies and some of the pit-falls in methods and data handling.

The second part describes the methods used to determine the residential waste compositions and per capita waste generation rates in three municipalities in Ontario: the Town of Fergus, the Borough of East York and the City of North Bay. Also included in the report are data on: solid waste composition and per capita waste generation rates for schools; chemical analyses on vacuum cleaner bag contents; the moisture content of combustible components in the residential waste stream; the heating value (kJ/kg content) of selected mixed plastics and disposable diapers; and a survey of some Ontario data on the generation rates of white goods and bulky items.

#### 1.2 Background Literature

#### 1.2.1 Canadian and Ontario Studies

#### The Bird & Hale Report (1978)

The acknowledged landmark of waste composition studies in Canada was the work reported by Bird & Hale (cited herein as, BH) in 1978 (ref. 5). Eleven cities were selected with populations in excess of 100,000 from across Canada. The average annual composition of municipal solid waste<sup>\*</sup> entering landfill sites, transfer stations and incinerators, was derived from samples obtained during the spring, summer, winter and fall. In Ontario, Toronto was selected for the study. Twelve visits were made to six sites between October, 1976 and September, 1977, with 2 visits apiece at: Commissioners Street Incinerator, Ingram Incinerator, Dufferin Incinerator, Beare Road Landfill Site, Bermondsey

municipal solid waste = residential + commercial

Transfer Station and Wellington Incinerator. Sample weights of municipal solid waste ranged up to 400 lbs. (180.7 kg).

The Ontario results of the BH waste composition study, averaged over the year (Table 9 in ref. 5), are shown herein in Tables 1 and 2. The per capita waste generation rate is given in Table 3. It should be pointed out that while we are using the BH data as a "standard" for comparative purposes, the Peter Middleton & Associates report of 1975 (ref. 32) summarized the results of 31 previous studies (United States & Canada), including 4, early 1970's studies from Ontario. Peter Middleton & Associates (ref. 32) noted that their review of waste composition studies was hampered by "six distortion factors": (1) the "solid waste" that was being studied; (2) the geographic location of the study; (3) the season of the year when the study was undertaken; (4) the year of the study; (5) the socio-economic background of the area where the "solid waste" for the study was generated; and (6) moisture transfer that occurred before sampling.

Giving "consideration" to these six factors, Peter Middleton & Associates tabulated "...the following percentage figures...developed for the average yearly composition by weight of <u>residential</u> solid waste in Southern Ontario on an "as generated" basis - 1974:

|                   | (%)        |                      |
|-------------------|------------|----------------------|
| Paper             | 35         |                      |
| Food Wastes       | 22         |                      |
| Yard Wastes       | 15         | (ranging from 0 - 20 |
|                   |            | over 12 months)      |
| Plastic           | 3          |                      |
| Rubber and        | 2          |                      |
| leather           |            |                      |
| Cloth             | 2          |                      |

TABLE 3: SUMMARY OF PER CAPITA WASTE GENERATION RATES

1 1 1b. = 0.454 kg.

<sup>2</sup> Reportedly obtained from: <u>Urban Solid Waste Generation Ontario</u>, July 1976, Ont. Waste Management Advisory Board, pg. 1. While the wide scope of the BH study understandably precluded a greater attention to sample size and sample number, two problems with respect to the BH procedures require some discussion in view of the major objective of the present Study: the development of a method for determining residential waste composition and per capita waste generation rate.

First, BH attempted to convert the weights of the sorted materials from a, socalled, "as received" condition, to a weight which more closely reflected the items in their original, or "as generated" state. While the "as generated" concept is a valid one, it is not possible to compute this value using predetermined factors in conjunction with the equation provided on page 10 of their report (ref. 5). The following discussion will point out some of the complexities that BH were attempting to address.

When moist organic matter comes into contact with dry materials (e.g. plastic, boxboard, or paper) there is a transfer of water from the organic matter to the surface of plastic packaging (=adsorption) or, for example, throughout the entire thickness of a piece of boxboard (=absorption), causing it to swell. Hence the organic matter loses weight, while the other materials gain weight. Under ideal (laboratory) conditions, the weight transfer of the water can be measured. Practically speaking however, the heterogeneous assemblage---and juxtaposition--of wet and dry materials in the average bag of residential refuse poses a much more complex problem than simple moisture transfer between the initially wet and the initially dry components.

Moist organic matter may also be found as a residual layer on surfaces of containers---metal, plastic, glass; or partially absorbed by paper products. The weight of this "tramp" organic matter cannot be "universally predetermined", but must be quantified for every case. The following example further serves to illustrate the complexity of the "as generated" problem.

The moisture content associated with a discarded can of spaghetti sauce, in which a thin layer of sauce is still adsorbed to the inner surface, is a function of the physical-chemical properties of the organic matter in the sauce, as well as the thickness of the sauce coating. In essence, it may be argued that the presence of the organic matter in the sauce increases the <u>apparent</u> amount of water adsorbed to the surface of the can. Put simply, a dirty can will have more moisture associated with it than a clean one. Thus, the weights of materials that we collected in the Study are reported in their "as received" condition; we did not attempt to derive any "as generated" weights.

It is difficult to justify pursuing this level of theoretical detail at the expense of time requirements and financial limitations which control the pursuit of the practical objectives of a waste composition study. Brunner & Ernst (ref. 8) alluded to this point while reporting that tramp organic matter may contribute significantly to the total organic fraction of the waste stream.

The second problem, illustrated by BH's inclusion of yard waste data in the calculation of percent (%) composition (Tables 1 & 2), concerns the misleading impact of quantitatively apportioning a "spurious event" over a time period which exceeds the actual duration of that "event". Again, Brunner & Ernst (ref. 8) may be cited for a relevant example: the mercury (Hg) content from a single battery that was mathematically apportioned over an entire load of refuse as if this were the true "background" level of Hg in all of the constituents of the load. The amount of mercury measured is, however, relative only to the battery and <u>not</u> the entire load.

In Ontario, yard wastes and leaves are not part of the residential waste stream throughout the year. The quantities of these materials in the waste stream not only vary with season but their occurrence in a municipality also varies with population demographics: detached residential dwellings versus apartments; young versus mature trees lining streets, etc. Over and above the false notion conveyed by incorrectly "weighting" seasonal components over the entire year,

as in the mercury example above, there are several equally inaccurate, practical consequences.

First, there is an important mathematical result when yard wastes are included in the calculation of percent composition of the more or less "baseline" components of the residential waste stream, e.g., food waste, Blue Box components, etc. When all of the components of the waste stream are normalized to the total ,i.e., the percentage of each component is computed as a proportion of the total, the inclusion of yard wastes as a component causes the other components in the refuse---which are present in the refuse throughout the entire year---to <u>appear</u> to be less abundant than they actually are. Brickner (ref. 7, Table 2) demonstrated the effect of eliminating yard waste from composition calculations. The seasonal waste composition results of Constantine <u>et al.</u> (ref. 11, Table 1) would similarly change if the yard waste component were removed. This computational problem will re-appear below.

Second, the design of a waste management facility will be different, depending on whether the arrival of the waste is spread out over an entire year or delivered in several large loads over a few weeks.

#### Other Studies

Two reports are briefly reviewed here because they feature either a provocative experimental design or a design that appears to have lead to a problem in data interpretation.

In 1984, the Toronto Recycling Action Committee commissioned an interesting study (ref. 16) to compare the composition of refuse generated on the basis of land use, ie., residential, retail, restaurants and an office tower. The residential sampling <u>strategy</u> was well conceived; residential refuse was collected from two streets in Toronto and per capita generation rates for this wasteshed population could have been readily determined. In addition, the refuse from the commercial

establishments was collected at the premises so that both per capita and land use calculations of waste generation could have been made. The report was published in 1985 (ref. 15). The concept of the curbside collection of residential refuse was central feature of the sampling plan developed in the present Ontario Waste Composition Study.

In the spring of 1988, Pollution Probe Foundation studied the waste generation of 68 households in Toronto to determine the quantity of recyclable components (ref. 31). As the sampling program evolved in complexity from the beginning to the end of the study (in step-wise fashion), a problem appears to have been encountered in the presentation of waste composition data. (See Table 4 of the "Hoggs Hollow" report (ref. 31, p. 16)). Newsprint was the only item partitioned from the total household refuse in week two of the study and it was reported In weeks 3 through 8, when other components, in addition to as 23.7%. newsprint, were separated and weighed, the percentage(%) of newsprint dropped to the following values: 17.3, 13.4, 16.9, 13.7, 20.9 and 13.9%. It is highly unlikely that the sudden decrease between weeks 2 and 3 was due to a reduction in newspaper readership or subscriptions. Insufficient quantitative information was provided to clarify and interpret the data presented in the table. A discussion of the presentation of waste composition data in the "percentage" format is given in Section 4.4

As a miscellaneous note, the important topic of "capture rate", ie., the <u>actual</u> quantity of recyclable materials collected via the Blue Box program versus the <u>potential</u> quantity of recyclable materials in the curbside refuse, is presented in Table 5 (p. 17) of the Pollution Probe report. Unfortunately, this table is not referred to in the text and according to the author of the report (pers. commun., G. Perks), no capture rates were determined for any of the households. Intended to serve an illustrative purpose, the table requires textual comment in order to prevent confusion.

#### Summary of Waste Composition Data For Ontario

Table 1 herein, presents the waste composition data obtained from formal and "informal" literature (post Peter Middleton & Associates review of 1975). It is difficult to judge the completeness of the original data that may have been generated since the BH report. For instance, some Waste Management Master Plans (not cited herein) seem to have applied (and changed, without explanation) the BH data. BH waste composition categories are reported with no changes in this report in Tables 1 and 2 and their results are shown in Column B of Table 1 and Column A of Table 2.

With the exception of columns L and M/M, ie., waste compositions for Presqu'ile Provincial Park and MSW in Quebec, respectively, the data pertain to both MSW and residential waste streams in Ontario, or other "combinations" of information.

On the basis of problems that were already alluded to above---and which will be discussed more completely in Section 4.4---the literature data presented in Table 1 cannot be easily compared. However, it is interesting to note that the values reported for food wastes are generally in the 20% range, with the exception of particularly low values of 7%, in columns E and I, (refs. 39 & 29). RIS (ref. 39) identifies their sources as: "compilation of data from U. S. Environmental Protection Agency, Environment Canada, Waste Sampling Study for the City of Windsor and Waste Composition Literature Reviews performed by State of Rhode Island and Massachusetts."

#### Residential Plastic Waste

The recent EPIC (Environment and Plastics Institute of Canada) study of postconsumer generation of rigid plastic container waste in Barrhaven, a residential area in Neapean, Ontario, near Ottawa (ref. 44), reported a generation weight of 7 lbs/capita/year (3.19 kg/capita/year). The composition of the plastic waste

stream was given as: HDPE + PP, 75%; PET, 12%; and PS + PVC, 13%.

A survey of the generation rate and composition of plastic <u>film</u> by residents in Peterborough, Ontario, is currently underway (pers. commun., Mr. J. Savage, ESSO Chemical). No data from this study are currently available.

#### 1.2.2 Foreign Studies

#### 1.2.2.1 United States

According to W. J. Rathje (ref. 33), the "disposable society" began in the mid-1800s. The earliest interest in discarded materials may be credited to an archaeologist who excavated the Andover, Massachusetts, town dump in the mid 1920s. In more recent times, knowledge about the kinds of "materials discards" that society generates have been of interest to two quite different groups of professionals: (1) those hoping to gain insight into archaeological interpretation of historical cultures by studying and analyzing modern material cultures; and (2) those hoping to develop the ways and means of reducing the volume of discarded materials through an understanding, in part, of the waste generation patterns of modern society. Oddly enough, while the objectives of these two groups, ie., archaeologists and professional engineers, respectively, are different, the methods employed by each group <u>should</u> have more in common with each other than may be presently acknowledged. Both archaeologists and engineers want to know the composition of the present day waste streams.

The job of conducting waste composition studies for governments has frequently fallen on the shoulders of companies with engineering expertise. These

companies have been traditionally associated with solid and/or liquid waste management. However, as Rathje noted in 1979, "The behavioral aspect of the legal disposal of solid wastes involves determining the broad socio-economic correlates of household discard behaviour, including variation in solid wastes relative to household demographic composition and social strata, time of year, and general state of the economy. A number of civil engineers and solid waste managers have recently begun to conduct such studies" (ref. 33, pg. 26).

The Peter Middleton & Associates review (ref. 32) cited three residential refuse studies conducted in 1969 and 1970 that concluded that lower income groups throw out a higher percentage of food wastes and wealthier families discard a higher percentage of paper. Cognizant of potential socioeconomic differences in waste generation, a fourth study focused a sampling program on a middle income residential area.

#### Waste Composition Studies

The number of municipal waste composition studies conducted in the United States is very large. For instance, a list of the studies conducted by SCS Engineers, Long Beach, CA, reportedly fills three typed pages (pers. commun., R. Grier), and currently includes waste compositions investigations for the cities of New York and Los Angeles. The results of studies shown in Table 2 were obtained with relative ease from available literature and is by no means complete. Again, the waste classification categories and first column of data on the left side of the Table are from Table 9 in BH.

#### Techniques and Methods

While the American Society for Testing and Materials is frequently cited as the "standard" for many analytical methods, the document in the series, whose title makes it appear appropriate for waste composition studies, i.e., ASTM F 889-82 (ref. 3), is of marginal use because it is expressly designed for use at

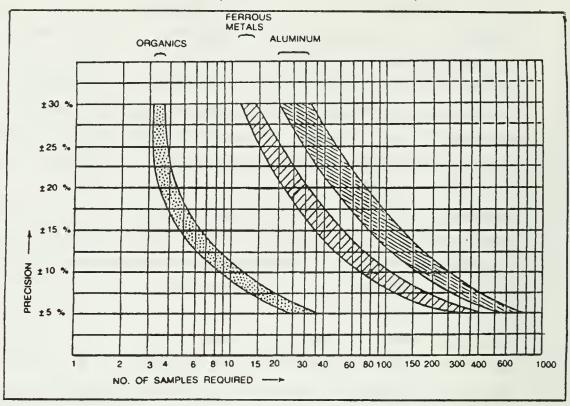

resource recovery facilities. The most notable individual who has significantly contributed to the "sample-and-sort" methodology is Dr. A. J Klee. Building on the statistical studies of Cochran (ref. 9), Klee & Carruth (ref. 25) reported a method, employing arcsine transformation of raw waste composition data, that enabled them to determine the minimum sample weight required to achieve appropriate levels of statistical confidence with respect to particular components in refuse. The results of their study showed that samples should weigh at least 200 lbs. (90 kg), but need not exceed 300 lbs. (135 kg) (ref. 24). Later, the method was adapted by Trinklein (ref. 45) in the design of a program for the sampling frequency of garbage trucks arriving at an energy-from-waste facility. The 200-300 lbs. (90-135 kg) sample weight range has been confirmed by other investigators (McCamic, ref. 28; also see Lohani & Ko, ref. 26).

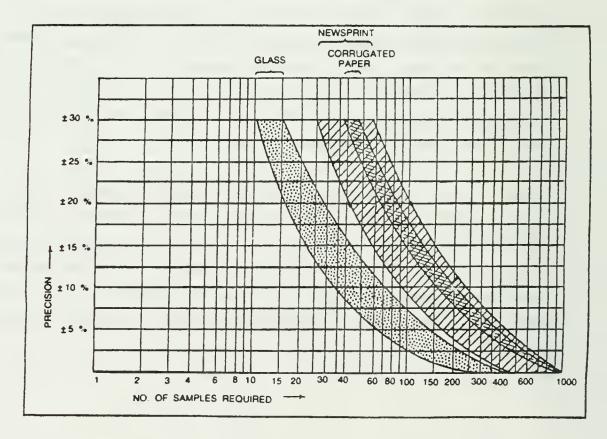

How many samples in this weight range must be taken? If one has an approximate idea of the percentage that component 'X' is usually expected in refuse and can assign a precision range that one would like to achieve, with 90% probability, e.g., component 'X' is expected to be 25% of the refuse, with a desired precision (of the estimate) of 20% of the expected value:  $25 \pm 20\%$ ; then one can determine the number of 200-300 lbs. (90-135 kg) samples which must be taken and sorted. Tables and nomograms may be consulted to obtain the requisite number of samples (see refs. 20, 40, 47 & 48) or the sample number may be calculated according to the equation found in Klee & Carruth (ref. 25) and which is given herein , Section 4.7.2.

Figure 1 shows nomograms for residential waste composition studies.

Sample number is a function of two major factors: component abundance (%), standard deviations of sample data and desired confidence limits. The sample numbers required for satisfactory statistical precision become unmanageably large when dealing with components that are a small fraction of the total refuse or when the desired results are to have a high degree of accuracy and probability. (ref. 28).

FIGURE 1: NOMOGRAMS FOR RESIDENTIAL WASTE COMPOSITION STUDIES SHOWING THE RELATIONSHIP BETWEEN SAMPLE NUMBER AND STATISTICAL PRECISION (WITH 90% CONFIDENCE).

Composition sample requirements, residential sources only (with 90% confidence)

An important contribution to development of a methodology for sampling refuse generated in a wasteshed was made by Rathje and co-workers. Their earliest noteworthy study, "THE MILWAUKEE GARBAGE PROJECT" (ref. 34) clearly demonstrated the relationship between socio-economic stratification of populations and the qualitative and quantitative composition of residential refuse. The concepts embodied in the Rathje methodology are also noted in some engineering sampling protocols, e.g., SCS Engineers (ref. 40), and are contemplated by Woodyard & Klee (ref. 48).

In a literature and protocol review conducted for the State of Massachusetts (ref. 28), considerable emphasis was placed on implementation of a wasteshed sampling program based on socio-economic and demographic characteristics of the wasteshed. As previously noted, some studies have addressed the importance of demographic characterization of waste generation (ref. 34), but few studies have come to light that report results on a demographically sound basis. A very recent study, again by the Rathje group (refs. 35 & 36) was conducted for the City of Phoenix and revealed patterns of refuse disposal along ethnic lines as well as a function of collection time during the week, a point already well known to refuse collectors.

#### Waste Generation Rates

Waste generation rates may also be computed as part of a materials balance where material inputs must be balanced by outputs. This approach can be applied on a national scale but is not feasible on a small scale because of the difficulty in obtaining accurate input values (see ref. 8). In addition, there are no provisions for sociological "interventions" in this strict flow-sheet approach. The recent Franklin report on waste generation in the United States (ref. 18) is one example of this kind of a study.

The selection of per capita refuse generation rates shown in Table 3 includes rates for residential as well as municipal solid waste. For the United States in 1920, the generation rate was 2.8 lbs.(1.26 kg)/capita/day. A value of 4.03 lbs.(1.82 kg)/capita/day was reported for 1986-87 and excluded industrial wastes and "under-reported" wastes (ref. 1). Several Canadian values are also referenced in Table 3. In a recent "popular" article on solid waste (ref. 37), Rathje mentioned the range of daily per capita generation rates that he is aware of: 2.9(1.31), 3.02(1.36), 4.24(1.92), 4.28(1.93), 5.0(2.26) and...8.0(3.61) lbs.(kg). In his opinion, even a daily rate of 3.0 lbs. per capita may be too high for some parts of the country.

#### 1.2.2.2 Non-North American

While the following sample of studies barely scratches the surface of the world literature, the references indicate the general applicability of the concept that waste generation can be correlated with socioeconomic patterns of human existence. Interesting data were reported by Sridhar et al. (ref. 41) for high, middle and low income families in Ibadan, Nigeria. The average putrescible content (kg/family) was positively correlated with high, medium and low income groups: 2.81, 1.52 and 0.37 kg/family, respectively. Coad (ref. 10) observed a large difference in the waste generation patterns of the wealthy and poor classes of society in Iran. A waste composition profile was recently reported for Minsk, USSR (ref. 6).

SECTION 2

METHOD DEVELOPMENT

#### 2.0 METHOD DEVELOPMENT

#### 2.1 Introduction: Rationale and Overview

It is reasonable to assume that both the quantity and the composition of residential waste generated in municipalities in Ontario has changed since the late 1970's when Bird & Hale conducted their landmark study (ref 5). Changes in packaging, technology, life styles and disposable income are some of the factors that can be expected to have altered the quantity and quality of residential refuse. The purpose of the present work was to develop a simple, cost effective and statistically meaningful method to be used by municipalities to determine the quantity and composition of residential waste, exclusive of leaves and other seasonal yard waste.

The method used in this study is based on the hypothesis that the characteristics of a residential waste stream are related to the socioeconomic lifestyles of people and the demographic characteristics of a municipality. Evidence from studies in the United States and elsewhere supports this hypothesis. The present method was developed by the team of Gore and Storrie Limited and Decima Research Limited.

The three municipalities participating in the method development study were selected in consultation with the Ministry of the Environment and fit into the three population categories that the Ministry required: small (population < 25,000), medium (population > 25,000 and < 100,000) and large (population > 100,000, belonging to Metropolitan Toronto). In deciding the three communities that would be approached to participate in the method development study, consideration was given to the following factors: (1) a municipality within Metro Toronto reflecting the earlier BH report; (2) municipalities outside of the sphere of Metropolitan Toronto; (3) geographic location in Ontario; (4) population and income distribution; and (5) housing type. Relevant information for the three study municipalities is given below, in order of increasing municipal population.

#### Town of Fergus

The Town of Fergus has a population of 6,757 (1988) and is located about 75 kilometres west of Toronto in Wellington County (Figure 2). Residential areas are generally composed of detached dwellings, occasionally interspersed with duplexes. There are also several neighbourhoods of apartments (3-4 floors; 35-60 units).

Residential refuse was collected weekly from detached dwellings by Plein Disposal; refuse from apartments was collected twice weekly by McLellan Disposal. A Class 1 residential Blue Box program, serviced detached dwellings (McLellan Disposal) but not apartments.

#### City of North Bay

The City of North Bay has a population of 51,313 (1989) and is located about 335 kilometres north of Toronto in the District of Nipissing (Figure 2). The residential areas are characterized by neighbourhoods of single detached dwellings; detached dwellings; duplexes and other attached dwellings; and neighbourhoods with small apartment buildings (3-4 floors; multiple units).

Residential refuse was collected weekly by Laidlaw Waste Systems Ltd. There was no Blue Box program or drop-off bins for recycling of materials in the City.

#### Borough of East York

The Borough of East York has a population of approximately 102,000 and is located in the Municipality of Metropolitan Toronto (Figure 2). The residential population is distributed in neighbourhoods of detached dwellings, frequently interspersed with small apartment complexes. There are also areas with numerous, large apartment buildings, each with several hundred units.

Residential refuse was collected twice weekly by Borough employees from detached dwellings and apartments with fewer than 30 units. Large apartment buildings also had twice weekly collection service provided by various private contractors. A Class 1 Blue Box program serviced detached dwellings and small apartment buildings but not large apartment buildings. Blue Box collection was also a Borough function.

### 2.2 General Overview of the Method

2.2.1 Demographic Description of a Municipal Population

#### 2.2.1.1 The Enumeration Area (EA)---General Description

Statistics Canada information about the population of a municipality may be provided for subunits of the population called Enumeration Areas (EAs). The information is derived during census gathering processes. An EA contains approximately 600 people but may frequently range over 800. The geographic area covered by an EA is determined by the type of housing; that is, a larger geographic area is occupied by a population that resides in detached, single dwellings than for a population of apartment dwellers.

Inasmuch as EAs are planned without specific regard for socioeconomic or other demographic factors, the likelihood that discrete socioeconomic sectors of a population are exclusively encompassed within an EA is greater in a large municipality than in a small one.

#### 2.2.1.2 Classification of EAs According to Income

Using the most recent Statistics Canada Census data, each EA in the study community was stratified according to income level. The format for the stratification was:

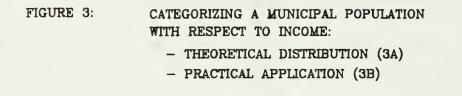

- High Income: average household income is at least 1/2 standard deviation greater than the mean income for the entire community;
- Medium Income: average household income is no more than 1.2 standard deviation greater than, or less than the mean income for the entire community;
- Low Income: average household income is at least 1/2 standard deviation less than the mean income for the entire community.

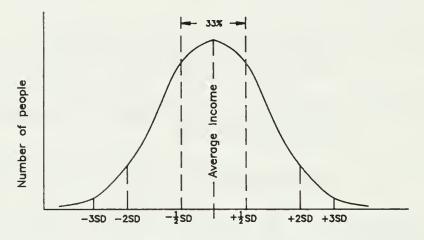

Figure 3 below illustrates the concept of population stratification by income, described above.

#### 2.2.1.3 Classification of EAs According to Housing Type

Within each income category, each EA was further classified according to housing type. For each EA, Statistics Canada reports the number of Single Detached residences, Apartments, and Other residences. These numbers, expressed as a percentage of occupied dwellings in the EA are used to identify the predominant housing type.

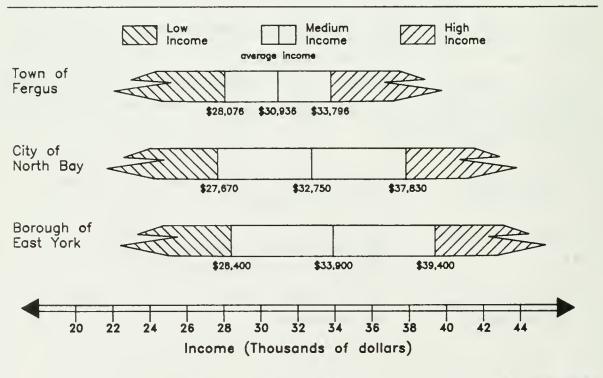

| Primarily Single<br>Detached:    | EAs with 60% to 70% of dwellings reported as single detached;                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Mixed Dwellings:                 | EAs with a mixture of single detached,<br>apartment buildings with fewer than 30<br>units, and "other" dwelling types; |
| Primarily Multiple<br>Dwellings: | EAs with 60% to 70% of dwellings reported as "apartments".                                                             |

(3A) Idealized representation of normal income distribution over a municipal population. The middle income range extends between -1/2 SD and +1/2 SD and includes 33% of the population.

(3B) Comparison of the low, medium and high income categories for the three municipalities in the Study.

An exact boundary line between dwelling classifications was not rigorously specified in this Study because of the need for flexibility to consider the distribution of the minor components of the residential mix for a particular EA.

The distribution of types of residences across the whole municipality was examined to ensure that specific cells in the income housing matrix were not grossly out of proportion to the total number of EAs.

Table 4 below shows the housing/income matrix that was used in the present study for classification of the EAs in a municipality.

#### 2.2.1.4 Income/Housing Matrix For the Town of Fergus

Using the most recent census data, the EAs for the Town of Fergus were classified according to the parameters of the income housing matrix (Table 5). Of the 11 EAs reported by Statistics Canada for Fergus, 9 were placed within the study matrix. Two EAs were not included: a hospital zone and an area of Town that extended outside the Town limits.

Table 5 lists the 6 EAs that were actually sampled in the study. Their location within the Town of Fergus is shown on the map in Figure 4.

#### 2.2.1.5 Income/Housing Matrix For the City of North Bay

Using the most recent census data, the EAs for the City of North Bay were classified according to the parameters of the income housing matrix (Table 6). Of the 66 EAs reported by Statistics Canada for the City of North Bay, 57 were placed within the study matrix.

Typical of communities in Northern Ontario, the City limits of North Bay encompass a large rural area outside of the built-up central portion of the City. The income/housing matrix only includes those EAs in the urban area of the

City. 9 EAs were omitted from the matrix because they were either outside the urban area or they lacked necessary information for categorization. For example a hospital zone, parts of the Canadian Forces Base, an Indian Reservation and rural areas were omitted.

The location of the 2 urban EAs that were sampled in the Study are shown on the map of the City of North Bay (Figure 5).

(Note: The City of North Bay was studied after the Town of Fergus and the Borough of East York. Based on the results of the latter municipalities, it was decided to conduct a much reduced sampling program in the City of North Bay. At the same time, it was also decided to involve an employee of the City's engineering department in order to assess the feasibility of implementing the Study methodology by City staff, after a suitable training period. The City employee was very confident that he could continue the study without further assistance from Gore & Storrie Limited).

#### 2.2.1.6 Income/Housing Matrix For the Borough of East York

Using the most recent Statistics Canada census data, the EAs for the Borough of East York were classified according to the parameters of the income housing matrix (Table 7). Of the 179 EAs that were reported by Statistics Canada, 170 were placed within the study matrix. The remaining 9 were excluded due to insufficient information for categorization. Table 7 gives the 7 EAs that were included in the study and their locations are shown in Figure 6, a map of the Borough of East York.

ENGINEERING DEPARTMENT

# 2.2.2 Residential Waste Sampling Plan Based on Municipal Population Demographics

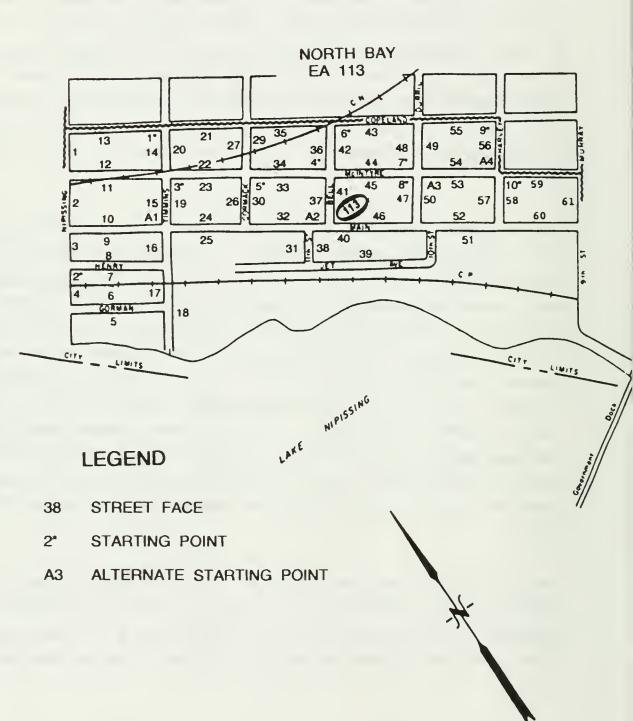

#### 2.2.2.1 Street Numbering and Collection "Starting Points"

The following is a general description of the procedure for setting up a sampling program in each EA. Every street "face" within an EA was given a number. This process proceeded systematically, starting in the upper left corner of the EA map, numbering left to right as street faces were encountered, ending up in the bottom right corner of the EA map. Opposite sides of a street bear different numbers, with eight numbered street faces meeting at an intersection of two streets. The map in Figure 7 shows the numbering systems in a typical EA (for purposes of example, EA 113 from the city of North Bay is shown here).

Next, a random number table was employed to randomly select "starting points" for the curbside waste collection program. For example, if the number 17 was determined randomly, street face number 17 was located. Then, <u>our convention</u> was to select the intersection at the eastern <u>or</u> northern end of the street as a starting point. Certain practical limitations to this procedure were encountered from time to time but were easily overcome. For instance, if the random numbers selected from the table resulted in potential starting points that were too close to each other, i.e., their locations did not permit the collection of a minimum quantity of refuse before encountering another potential starting point, alternative starting points were chosen, as indicated below. In the field, starting points that were too close to each other were frequently "over-run" in order to collect the required weight of refuse at curbside (see also Section 2.2.2.2 below).

Nine starting points, indicated by an \* on the map in Figure 7, and 3 or 4 alternate locations (indicated by an A1, A2, etc.) were usually supplied. No preference was implied between the first 9 and the latter 3 or 4 starting points, or the sequence in which the sampling occurred. However, there was a

FIGURE 7: EXAMPLE OF ONE EA SHOWING NUMBERING OF BLOCK FACES AND SAMPLE COLLECTION "STARTING POINTS"

standardized, CLOCKWISE direction of collection from each starting point that enabled us to drive and collect waste on the right hand side of the street, proceeding clockwise around corners and into and out of cul-de-sacs. Alternative starting points were almost always used, for the reasons noted above.

The sampling of small and large apartment buildings, when they were either part of an EA or constituted an entire EA (by virtue of their size), respectively, will be described below in Section 2.2.3.5.

#### 2.2.2.2 Problems Encountered

As the distribution of dwellings in an EA was not known by the study team from prior experience within any of the municipalities, several minor problems arose as a result of the random and "blind" determination of starting points in EAs. On the one hand, there was complete impartiality in assigning the starting points. On the other hand, some streets were sparsely populated, factories or commercial enterprises were present on others or waste from second floor apartments over commercial premises was co-disposed with commercial waste. The difficulties were readily overcome, on-site, by using the designated alternate starting points. If these latter points were exhausted, additional locations were randomly selected from the remaining potential starting points, i.e., street intersections, in the EA.

## 2.2.3 Data Acquisition: Collecting and Sorting Residential Refuse

#### 2.2.3.1 Collection Equipment

The following list of equipment includes rented vehicles and purchased equipment:

one - 4.3 m.(14 ft.) cube van (for collection of bagged refuse); one - pick-up truck (for collection of Blue Box contents);

- one electronic platform scale (150 kg capacity, Accu Weigh Model PAK-150 (electronic, battery operated scale with digital read-out), Exact Weight Scale, Inc., Toronto, Ontario);
- six 1.2 m.(4 ft.) x 1.2 m.(4 ft.) x 1.2 m. (4 ft.) heavy duty corrugated containers ("gaylords"); these containers were used for storing the bagged (non-Blue Box) refuse samples as they were being collected;
- four 1.2 m.(4 ft.) x 1.2 m.(4 ft.) divider frames (2.5 cm. x 5.1 cm. wood furring stock/chicken wire); these were used as horizontal partitions in the back of the cube van for separating the collections of bagged (non-Blue Box) refuse which were stacked on top of each other;
- two 46 cm.(18 in.) x 2.4 m.(8 ft.) divider frames (2.5 cm. x 5.1 cm. wood furring stock/chicken wire); these were used as the two main partitions in the back of the pick-up truck for segregating the collections of Blue Box materials (see Figure 8);
- nine -46 cm.(18 in.) x 41 cm.(16 in.) (approx.) plywood panels; used as partitions in the back of the pick-up truck (see Figure 8);
- one chicken wire "crib": 1.2 m.(4 ft.) x 1.2 m.(4 ft.) x 1.3 cm.(1 2 in.) plywood base; 0.6 m.(2 ft.) high chicken wire and 2.5 cm. (1 in.) x 5.1 cm.(2 in.) furring sides. Nailed to the underside of the crib floor was a square frame which permitted the crib to be centred on the bed of the platform scale (see Figure 9); the crib was used for weighing the refuse as it was being collected from curb-side;
- 150 50.8 cm.(20 in.) x 76.2 cm.(30 in.) x 6 mil polyethylene bags (Oxford Packaging Inc., Mississauga, Ontario); these were used for bagging refuse that was set out loose in garbage cans; the bags were also used for storing refuse samples for moisture and chemical analysis;
- 40 30 litre polyethylene garbage cans; these were used as containers into which sorted refuse was placed (see Figure 10);
- one 2.7 m.(9 ft.) x 3.7 m.(12 ft.) reinforced plastic tarpaulin for covering Blue Box materials in the pick-up truck;
- six elastic straps to secure the tarpaulin in place;
- one broad-mouth aluminum shovel; used for cleaning up spills;

# FIGURE 8: PHOTOGRAPH OF PICKUP TRUCK WITH COMPARTMENTS FOR BLUE BOX MATERIALS.

# FIGURE 9: PHOTOGRAPH OF CHICKEN WIRE CRIB MOUNTED ON THE PLATFORM SCALE (REAR VIEW OF CUBE VAN)

one - broom; used for cleaning up spills and sweeping out the vehicles;

- one staple gun and 0.95 cm.( 3/8 in.) staples for construction and repair of chicken wire dividers and crib;
- one claw hammer; 5.1 cm.(2 in.) common nails: used in the construction of the crib and divider frames.

#### Special Requirements In Each Municipality For Sample Sorting

### a) <u>Town of Fergus</u>

The field study took place between: July 15 and August 31, 1989.

Written approval was received from the City of Guelph that enabled the Study to use the landfill site as its base of operation, with space for sorting the refuse samples, an eating area, washroom facilities and helpful guidance from the municipal staff.

The refuse was sorted, weighed and disposed of at the landfill site. The sorting of bagged refuse took place on the tailgate of the pick-up truck (see Figures 10 & 11), following the sorting and weighing of the Blue Box materials stored in the truck. Several sheets of plywood, resting on the tailgate, extended the working surface to comfortably accommodate four people, surrounded by the garbage cans.

#### b) <u>City of North Bay</u>

The field study took place between: February 21 - 28, 1990.

The assistance of one employee of the City Engineering Department was provided to complete the Study team (as noted above). Written approval was received from the City of North Bay that permitted the Study team to use the Work's Yard as their base of operations. Available at that location were: an eating area, washrooms and a telephone.

A large 7.6 m.(25 ft.) x 7.6 m.(25 ft.) carnival tent (see Figure 12) was used as a sorting area at the City's Work's Yard. The tent, supplied by the City of North Bay, provided storage space for the samples and protection for the Study crew from the winter weather. Two, 15,000 BTU propane heaters (see Figure 13) were used to heat the tent. Refuse was sorted inside the tent on a plywood table, mounted on saw horses.

Several combinations of protective clothing were experimented with by the Study crew. In addition to heavy duty rubber gloves and safety glasses, cotton coveralls, a large rubber apron and a hat seemed to provide adequate protection. On very cold days, a nylon parka or shell was worn.

Sorted and weighed samples were disposed of in a 18.3 m.(20 yd.) roll-off bin, rented from a private hauler. When full, the bin was taken to the landfill site for disposal of the waste and an empty bin was left in its place.

#### c) Borough of East York

The field study took place between: October 24 and December 28, 1989. Written approval was received from the Municipality of Metropolitan Toronto that enabled the Study to use the Commissioners Street incinerator as its base of operation, with space on the tipping floor for sorting refuse, a heated office and washroom facilities and helpful guidance from municipal staff at both the incinerator and the Bermondsey Transfer Station.

The refuse was sorted, weighed and placed in a 18.3 m.(20 yd) roll-off container, rented by Gore & Storrie Limited for the duration of the study. The sorting of refuse was conducted off the tailgate of the pick-up truck, as described for the Town of Fergus. Arrangements were made with a private hauler to have the container taken to the Bermondsey Transfer Station for disposal when the container was full; an empty container was left in exchange.

FIGURE 12: PHOTOGRAPH SHOWING THE CARNIVAL TENT IN WHICH REFUSE SORTING WAS CONDUCTED.

FIGURE 13: PHOTOGRAPH SHOWING THE PROPANE HEATERS, REFUSE SAMPLES UNDER BLUE TARPAULINS AND ONE CORNER OF THE PLYWOOD SORTING TABLE (LOWER LEFT CORNER OF PHOTOGRAPH) MOUNTED ON SAW HORSES INSIDE THE CARNIVAL TENT.

#### 2.2.3.2 The Field Crew

Four or five people were needed for the waste collection task where a Class 1 Blue Box program was in place (Town of Fergus; Borough of East York): two truck drivers, one collection data recorder and one (or two) people to pick up the bagged refuse and Blue Box materials. Occasionally, a 5 day work-week was not long enough to complete the collection and sorting operations and an additional work day (Saturday) was required.

In North Bay, where there was no Blue Box program in place, a three member crew carried out the refuse collection. It should be noted that the reduced crew number required that they work an extra full day, i.e., Saturdays, to complete the sorting and weighing of waste.

Personal equipment included:

- heavy duty, waterproof (PVC-coated) gloves;
- work clothes or coveralls; apron; hat
- steel toed work boots;
- eye protection;
- tetanus/polio vaccination (optional: diphtheria, Hepatitis A and Hepatitis B);
- traffic safety vest;
- particle masks, worn by crew members concerned with dust and the possibility of disease transmission;
- anti-bacterial soap, used to clean gloves, hands and face before meal breaks and at the end of the day.

#### 2.2.3.3 Documents and Meetings

Two important documents were obtained from the Ministry of the Environment, Waste Management Branch. The first authorized the collection of waste for the Ontario Waste Composition Study; the second was a letter to be given to any individual in the municipality who was interested in learning more about the ongoing residential Study. Following Ministry of the Environment approval to consider a municipality for inclusion in the Study, a meeting was arranged with the municipality to discuss the aims of the Study and "invite" the municipality to participate. Following the meeting, a formal letter of request was sent to the municipality.

A high level of coordination, to ensure scheduling of refuse collections, required weekly meetings and numerous phone calls between the Study Project Manager, municipal staff and waste haulers. Each week, a map of the EA scheduled for inclusion in the refuse study was delivered to municipal staff and/or the waste haulers. There was only one incident during the entire Study when the "line of communication" failed, but only briefly.

A similar level of coordination was required in order to obtain permission to include small and large apartment buildings in the Study. Usually the details were arranged through phone conversations with apartment owners and building managers and waste haulers, but occasionally written requests for permission were prepared.

In North Bay, a press release was issued by the City to inform its residents about the City's participation in the Ontario Waste Composition Study.

# 2.2.3.4 Waste Collection Process: Detached Dwellings---General Procedures

The goal of the waste collection process, on any one day, was to obtain 10 (9 as a minimum), 100 kg (minimum weight) samples of residential waste--exclusive of the weight of Blue Box materials and yard waste that were also coincidentally collected if they were placed curbside. This task proceeded as quickly as possible, with a 0700 h start, so that the normal collection of waste and Blue Box items by the municipality was not seriously inconvenienced. The waste sample collection began at one of the starting points (refer to Figure 9). Waste was collected in front of every dwelling where it was set out, until approximately 100 kg were accumulated in the crib (Figure 12), some variations to this are noted below. An "en route" collection record was kept of the number of dwellings that had waste set out: general waste and/or Blue Boxes. Single and duplex dwellings were also indicated.

The importance of the "en route" collection record and the accuracy of the recording of the number of dwellings that were sampled should be noted. The team member who recorded the trip data did not have time to concentrate on any other aspect of the curb-side collection process.

Loose waste set out in garbage cans was rebagged in clear polyethylene bags. These bags were reused and not included in the analyzed waste sample. The collected waste was placed in the chicken wire crib which was mounted on the platform scale on the floor of the van (see Figure 9). The scale was tared with the empty crib on it, prior to filling the crib with waste. When the minimum required weight of waste had been collected (with an allowance for the estimated inclusions of yard waste co-disposed with household waste), the crib was unloaded and sample was stored in the van.

Corrugated gaylords were used to store six of the waste collections. Two of the remaining collections were piled on top of  $1.2 \text{ m.}(4 \text{ ft.}) \times 1.2 \text{ m.}(4 \text{ ft.})$  chicken wire dividers placed on top of the collections in the gaylords. The ninth collection of bagged refuse was piled on top of the Blue Box materials, stored in compartments in the pick-up truck (see below), while the tenth collection was kept in the weighing crib.

Yard waste set out at the curb was weighed at the time of sample collection. The weight was recorded and the yard waste was placed back at the curb for municipal waste collection. (Note: the Town of Fergus issued a notice that yard

waste should not be set out for collection but this edict appeared to be widely ignored).

Blue Box items were placed in the corresponding sample compartment in the back of the pick-up truck (Figure 8). There was space for 9 collections in the truck; the tenth collection was stored in polyethylene garbage cans in the van.

It took between 2 and 2.5 hours to make 9-10 collections within an EA. Following the last collection, the contents in the pick-up truck were covered with a tarpaulin. Elastic straps secured the crib and contents in the back of the van. The Study team proceeded to the base of operations in the municipality and began sorting the samples.

# Special Requirements In Each Municipality For Sample Collection

# a) <u>Town of Fergus</u>

Municipal solid waste was collected on Wednesday or Friday, depending on whether the street address was on the North or South side, respectively, of the Grand River. In several cases, EAs were intersected by the River and the sampling programs required waste collections on both days.

#### b) City of North Bay

Municipal solid waste was collected on Tuesday or Wednesday, depending on the street location in the City. The short time interval between the City's agreement to participate in the Study and the timing of the first curb-side collection precluded a careful coordination of the Study's collection route and the normal collection routes of the City's refuse contractor. Thus the Study crew had to commence sample collection at 0500 h and finish by 0700 h, in order to avoid having the waste picked up by the regular collection service.

#### c) Borough of East York

The Borough of East York had a twice weekly curb-side collection program: Monday and Thursday or Tuesday and Friday, depending on whether a street was West or East, respectively, of Greenwood Avenue. Therefore, two trips were made to collect waste from the same sample areas, i.e., using the same starting points, in each EA.

Staff in the Borough of East York indicated that about 60% of the weekly volume of refuse was placed at curb-side for the first of the two weekly collections, with about 40% set out for the second collection. This ratio was not universally reliable for all of the EAs in the Borough. With a target of 100 kg (minimum weight) of waste that had to be collected for a sample of adequate size, the following collection protocol was developed and illustrated in the example below.

For a given sample, approximately 60 kg of bagged refuse was collected from approximately 7 houses, on the first collection day. The collection on the second day was initiated at the same "starting point" in the EA and waste was collected from the same number of dwellings. This ensured that an accurate per capita generation rate could be estimated. In theory, the 60/40 relationship would also result in approximately 40 kg of refuse collected on the second occasion, for total of 100 kg of waste for the composition analysis.

The uncertainty of the 60/40, or any other ratio, required that we "overcompensate" with respect to the weight of the first collection in each sample by picking up more than 60 kg (e.g., 70 kg) from approximately 9 dwellings. This "insurance" weight meant that the crew was required to pick up from 9 dwellings on the second collection day. The total sample weight, that is, the sum of two collections, would therefore not likely be less than 100 kg. Of course, the fear was that the weight of refuse collected from the nine

dwellings on the second day would put the total considerably over the 100 kg point and require additional hours of sorting.

Waste collection from apartment buildings did not present this kind of a sampling problem (see below).

### 2.2.3.5 Waste Collection Process: Apartment Buildings

#### Special Requirements In Each Municipality

a) <u>Town of Fergus</u>

100 kg waste samples were removed from the waste bins at each apartment building for the composition analysis. In some cases, 2 - 100 kg samples were taken. The residual waste that remained after the sample(s) was taken, was removed, weighed and returned to the bin for normal pick-up.

The normal waste collection schedule for apartments was on Monday and Friday. Our collections were made on Fridays, only, and per capita generation rate calculations accounted for the 5 day period of waste accumulation. The number of units in each apartment was determined as well as the occupancy rate.

(Note: the weakness of this procedure, i.e., the omission of collection of refuse generated over the weekend, was rectified later in the Study in the other municipalities. It is possible that the estimated per capita generation rates for this sector of the Fergus population is lower than it might have been, had the calculations included the 3 day part of the week, i.e., the weekend, when people are frequently at home and the refuse generation may be expected to be higher than during the Monday to Friday period.)

#### b) <u>City of North Bay</u>

In North Bay, waste was sampled from small apartment buildings (fewer than 30 units) only. This waste was placed curb-side at the buildings that were part of the collection route, therefore no particular problems were encountered. The quantity of waste placed at the curb was sufficient to comprise a single sample per building (125.6 kg and 105.3 kg). The number of units occupied in each building was determined later and recorded.

# c) Borough of East York

#### Small Apartment Buildings

The waste from apartment buildings with up to 30 units was collected by the municipality as part of the curb-side residential collection program. Frequently such premises were part of the sampling areas in the Study EAs. The following procedure was applied. On the first collection day, approximately 60 kg was randomly taken from the curb-side pile of bagged waste, weighed and placed in a gaylord. The remaining portion of waste was weighed and replaced at the curb for collection by the Borough's garbage brigade. A similar procedure was followed on the second collection day, except that about 40 kg of waste was randomly collected, with the remainder being weighed and returned to the curb.

A general problem with the small and large apartment buildings was that despite the knowledge of the number of units that were actually occupied, we could not be certain that ALL tenants put out their waste for the collections that we sampled. In our calculation of the per capita waste generation rate we have multiplied the number of units by the Statistics Canada data for average population per dwelling to obtain the estimated number of residents in the apartments. The weight of waste set at the curb (or accumulated in the refuse bins) was divided by the apartment population. Our calculations could underestimate the per capita generation rate if some of the residents did not discard their refuse in a pattern which was coincident with the normal refuse collection pattern. Unless tenants received specific instructions from apartment managers, tenants could be "isolated" from the regularity of garbage collection:...down the garbage shoot...out of sight, out of mind...at least it is not smelling up my unit.

When Blue Box materials, especially grocery bags of newspapers, were placed at the curb in a manner which obviously intended that they would be collected by the Borough's recycling truck, the team placed the materials in the appropriate section of the pick-up truck. Again, as noted above, we did not know how many of the apartment units (number of tenants) contributed to the separate pile of Blue Box materials.

#### Large Apartment Buildings

Two large apartment buildings were EAs unto themselves: EA 12-055 and EA 90-055. They were treated as individual EAs in that nine, 100 kg samples were collected from each of the two buildings. The following discussion describes the procedures employed at EA 90-055, which serves as the example.

Under normal circumstances, waste collection, by a private hauler, was made twice a week (in both of the EAs). Thus, the Study team applied the "60.40" sampling plan described earlier for the Borough of East York (Section 2.2.3.4). Six bins of waste were set out on each collection day. On day 1, approximately 60 kg of waste were randomly taken from the top of each bin; these collections were the first 6 samples. For the last 3 samples, the bins were paired and resampled so that each sample contained waste from 2 bins.

Prior arrangements were made with the apartment's hauling company to provide an empty front end/overhead packer truck to pick the waste remaining in the 6 bins and deliver it directly to the Bermondsey Transfer Station for weighing and disposal. The weight of the waste was telephoned to the hauler's office from the Transfer Station and the datum was relayed to Gore and Storrie Limited.

A similar sequence of operations was followed on the second collection day, except that the sample weights of waste removed from the bins were approximately 40 kg. The sum of the 18 sample weights and 2 residual weights gave the total weight of refuse generated by the "towering" EA during the week.

#### 2.2.3.6 Special Collections

#### Yard Waste

Yard waste set out at the curb was weighed and replaced at the curb for the regularly scheduled municipal refuse collection. The weight of yard waste recorded "en route" for each sample was later combined with the yard waste that was co-disposed with household refuse to give a total weight of yard waste for the sample.

While the weight of yard waste is recorded, herein, on the raw data sheets for the waste composition (see Appendices A2, B2 & C2), it may be **NOTED THAT** the calculations of per capita generation rates and waste composition percentages in the present Study do not include the yard waste component. An explanation for this decision in data handling may be found in the Literature Review (see Section 1.2.1).

#### Leaves

A figure for the reported tonnage of leaves collected from the Borough of East York during the fall, 1989, was obtained from staff at the Commissioners Street Incinerator and confirmed by staff in the Borough Work's Department. The reported weight was 1,115.2 tonnes.

# <u>Schools</u>

Special arrangements were made with the Borough of East York Work's Department that enabled the Study team to collect waste from 7 schools: 4 primary, 2 junior high schools and 1 high school. The curb-side sample collection method was the same as that used for small apartment buildings described above in Section 2.2.3.5 (Borough of East York---small apartment buildings).

#### <u>Christmas</u>

Residential refuse was collected from EA 90-117 (middle income / primarily detached dwellings) on 28 December 1989. Blue Boxes were not set out at the time of this Christmas week collection. The EA had been initially sampled on 28 and 30 November, 1989.

# 2.2.3.7 Equipment For Waste Sorting

The following equipment and supplies were needed for the waste sorting and composition analysis:

- 1-150 kg capacity platform scale (noted previously);
- 1-5 kg capacity scale (Accurate model 5000 (electronic, battery operated with digital read-out), Exact Weight Scale Inc., Toronto, Ontario);
- 40-polyethylene garbage cans (note above);
- 1-claw hammer;
- 1-slotted screw driver;
- 1-electrician's pliers;
- 4-magnets
- pairing knives for opening plastic bags
- Personal equipment was listed above in Section 2.2.3.2.

#### 2.2.3.8 Personnel

#### Town of Fergus

Four students from Sheridan College in Mississauga, Ontario, and a graduate of the University of Toronto were the Study crew on this phase of the work. They possessed a background in science or engineering and had a working knowledge of measuring techniques, the care of reasonably delicate equipment and data recording. At the outset of the work they were given instruction, by Dr. Fred Edgcombe, Executive Director, Environment and Plastics Institute of Canada (EPIC) in the kinds of plastics that would likely be encountered during the survey of residential waste.

It was emphasized that the Study was really a "laboratory situation". Thus attention was given to organization, routine, reproducibility, consistency---even the cleanliness of garbage cans, van floor etc. This approach attempted to maximize a scientific attitude and thoughtful responsibility leading to careful work habits that the students learn as part of their analytical training.

#### Borough of East York

Three members of the Study team departed prior to the time the Borough of East York Study got underway, however one Study team member remained to give important continuity for the work. The three new Study team members were university graduates in science and liberal arts, with practical waste composition experience or with the objectives of the Study serving as a "cause célèbre" for their participation.

#### City of North Bay

The three Study team members included two of the Borough of East York team and one staff member of the City of North Bay Engineering Department. The latter individual was a University graduate with a science background and, at the time, was training to be a Recycling Co-ordinator.

#### General Attitudes

It took about 2 weeks of sorting waste before the Fergus Study team had "risen above" the physical (distasteful) aspects of the work and saw the larger picture, i.e., the residential waste characteristics of the citizens of Fergus.

In the other two municipalities, the Study team reached a level of proficiency earlier than the Fergus team. It should be noted however, that the working conditions in Guelph, e.g., high temperatures, direct sun, blowing dust, flies, a general maggoty condition of the refuse and very strong odours produced in the heat, were <u>much</u> more "trying" conditions than those experienced by either of the other Study teams.

### 2.2.3.9 Sorting Routine

#### Blue Box Materials

Each compartment of the pick-up truck was sequentially unloaded and the Blue Box materials were sorted into the categories noted at the bottom of the data sheets found in Appendices A2, B2 & C2. The separate categories of materials were placed into 114 lit.( 30 gal.) polyethylene garbage cans, which had uniform tare weights of 1.8 kg., and the weight of each material was determined. The weights of the Blue Box materials were entered on the appropriate waste sample data sheet. The sample data sheets were identical to those shown in Appendices A2, B2 & C2.

The materials collected in the Blue Box program in the Borough of East York included rigid plastic containers and OCC (Old Corrugated Containers), items that were not part of the recycling program in the Town of Fergus.

The City of North Bay did not have a Blue Box program.

Blue Box materials were separated into the following categories\*:

- a) Newsprint, including coated paper inserts
- b) Liquor/wine bottles
- c) Food jars/other bottles
- d) Food cans (i) ferrous
  - (ii) non-ferrous
- e) Beer cans (i) ferrous
  - (ii) non-ferrous
  - (iii) American
  - Pop cans (i) ferrous
    - (ii) non-ferrous
- g) PET bottles
- h) Rigid plastic containers
- i) OCC

f)

\*items a-g in the Town of Fergus; items a-i in the Borough of East York

# "Bagged" Residential Refuse

The contents of the remainder of the residential waste stream, i.e., the largely bagged refuse, were sorted according to the categories of items listed on the data sheets found in Appendix A2, B2 & C2. Blank data sheets were used to record the weights of the categories of waste. The samples were sorted one at a time by the sorting team.

Each 100 + kg sample was unloaded from the cube van and sorted. The 9-10 samples collected in an EA were sorted over a 3-5 day period. A sorting routine was developed as follows. Garbage cans into which the various components of the waste were sorted, were arranged in an array around each sorter (see Figure 10)---with the following notation of "handedness", in respect to containers for plastics and paper, to permit the sharing of containers between sorters. Directly in front of each sorter (or nearly under the sorting table) were his/her own receptacle for food waste, with containers for polyolefins (polyethylene & polypropylene) and assorted paper tissue on either side of the central food container. Then, progressing backward on the left (or right) hand side was a grouping of containers for other kinds of plastics. On the opposite side, were containers for other categories of paper items. Hence, the "handedness" aspect of container placement permitted the person on the left to sort plastics with the right hand while the person to the right sorted plastics with the left hand. Containers for metals, glass, diapers---categories of materials that could be lobbed some distance to shared containers---were located behind the sorters.

The "handedness routine" was devised to minimize the handling of the same material twice, i.e., transferring an item between hands, and to speed up the sorting efficiency.

Items that were not easily classified, that is, they were composed of several materials that could not be readily separated from each other e.g., light bulbs, costume jewellery, electrical equipment, etc., were weighed separately (or simply counted, as in the case of light bulbs) and recorded on a sheet of "miscellaneous items" for each sample (see Appendices A2, B2 & C2).

Note: The weights of all of the components were summed and the percentage of each component was determined on the basis of this sum and not the weight of the sample determined <u>en route</u>, during curbside collection. As noted above, 3-5 days were required to sort the residential refuse collected from an EA. During this time, the samples lost some weight, presumably via evaporation of water. Under the summer conditions during the Study in the Town of Fergus, moisture loss occurred during the sorting process, as bags of refuse were opened and air exchange promoted evaporation of water, particularly under sunny or windy conditions.

Under the winter conditions during the latter part of the Study in the Borough of East York and for the entirety of the work in the City of North Bay, the

garbage was frozen. This created a problem for separating frozen items, particularly food which was frozen to packaging. There was also less evaporation of moisture when the separated items were exposed to the open air.

Table 8 is a copy of the field data sheet used in the study showing the categories into which the household refuse was separated.

#### Notes On the Categories

Dr. Fred Edgecombe, Executive Director, EPIC (Environment & Plastics Institute of Canada) recommended that we group all polyethylene and polypropylene containers and film plastics together as "polyolefins" (item 5a), rather than trying to distinguish between polyethylene of different densities and crystal linearity. A small amount of SARAN wrap (polyvinylidene chloride) would also have been included in this category.

The PVC category (item 5b) was restricted to rigid containers; the vinyl category was reserved for other materials such as scraps of vinyl siding.

A simple "smoke and drip" test, provided by Dr. Edgecombe, was used to assist in determining the category for a particular plastic item. The test is included as Appendix D but it should not be viewed as a definitive qualitative method when used by itself.

Mixed blended plastics (item 5f) were reserved for plastic packaging around meat products. Coated plastics (item 5g) were for packaging in which the plastic portion was judged to be the greatest percentage by weight, e.g., potato chip bags. The "Tetrapak" boxes were categorized as mostly paper (boxboard) and included in item 1d.

Rodent bedding (item 6a) was routinely encountered in small quantities of urinesoaked cedar shavings and faecal pellets. The material was included in the food waste category because of the putrescible nature of both of the components. Likewise, individual "packages" of canine excreta---presumably contributed by citizens obeying the "poop-and-scoop" statutes---were included in this category. Kitty litter (item 13) was more frequently encountered and because of the inorganic nature of the granular product, save for the associated feline excretory products, the two components were given a single, separate category.

Sanitary napkins were included in the paper category (item 1i).

Medical wastes (item 14) included medicines, insulin bottles and associated used syringes (needles protected and unprotected) and syringes without accompanying evidence of medicinal application.

Aerosol cans were collectively weighed and included in the ferrous section as item 3d. At the time, we felt that one category for ferrous/non-ferrous pressurized containers would be adequate.

#### 2.2.3.10 Moisture Content

After the waste was sorted into the designated categories and weighed, samples of plastics, paper, food waste and disposable diapers were placed in large polyethylene bags and stapled shut. The bags were labelled with the appropriate sample numbered and then taken to the laboratory of the former Ontario Centre for Resource Recovery (now known as the Dufferin Transfer Station), Toronto. The contents of the bags were weighed in tared, aluminum baking pans (purchased in local supermarkets) and placed in the waste drying oven at 203 F(95 C) for 48 h. The samples were removed from the oven, cooled and reweighed to determine the weight loss due to evaporation of water.

A Sartorius top-loading balance (Model # 3802; 6 kg capacity  $\pm$  0.1 g) was used for the weight determinations.

#### 2.2.3.11 Inorganic Analyses of Vacuum Cleaner Bag Contents

Bags of vacuum cleaner dust/fibre/hair were frequently encountered in residential waste. As the curbside separation of the residential waste stream is expanding beyond the bulky items presently included in municipal Blue Box programs, it was decided that the chemical composition of the contents of vacuum cleaner bags may be instructive, for example, with respect to the decision to employ a two versus three stream "wet-dry" separation procedure. That is, the heavy metal concentration in the acid-extractable fraction of the vacuum cleaner bag contents could determine whether to exclude these items from the category of waste that will be composted, i.e., due to growing concerns with heavy metal loadings in some kinds of compost prepared from residential waste streams.

While it may be argued that the chemical composition of commercial paints, coatings and inks---or the pigment in the bright yellow HDPE detergent bottles---may be available through Material Safety Data Sheets or on a "need-to-know" request, the inorganic composition of house dust may only be gained through empirical experience, i.e., direct chemical analysis. Furthermore, depending on the geographic location of a municipality, the amount of vehicular traffic occurring within it and local industry, one may hypothesize that there will be differences in the chemical composition of the contents of vacuum cleaner bags.

In the Town of Fergus, vacuum cleaner bags were saved and grouped by EA. One bag was chosen at random from each EA for analysis. Fibrous contents and dust were pulled from the selected bags, placed in acid-washed plastic jars and submitted to X-RAL INC. for a 30 element inorganic analysis by ICP spectroscopy, plus analyses for mercury (Hg) and arsenic (As).

A similar procedure was followed in the Borough of East York except that the pooled sample was made up from the vacuum cleaner bags collected from each EA. No analyses were performed on the bags collected in the City of North Bay.

#### 2.2.3.12 BTU Analyses of Selected Components

The following samples of mixed plastic packaging were obtained from the residential waste stream, washed with detergent, thoroughly rinsed, oven dried (101 C) to a constant weight and submitted for BTU analysis: (1) prepackaged meat containers; (2) prepackaged bacon wrap; (3) plastic ketchup bottle. In addition, a new disposable diaper was similarly oven dried and submitted for BTU analysis.

#### 2.2.4 Data Management

#### 2.2.4.1 General Considerations

As noted in the preceding sections, data were collected at different points during the collection and sorting of residential refuse. Table 9, summarizes the kinds of data that were collected and the intended use of these data.

# 2.2.4.2 Calculation of Per Capita Generation Rate

### Estimation of the Per Capita Generation Rate in an EA

Table 10 serves as an example of how per capita generation rates were computed from the sample data (Appendices A1, B1 & C1) for each EA. The example cited in Table 10 is EA 258 from the Town of Fergus. The weight of waste used for this calculation was made up of either household waste alone or household waste and Blue Box materials, depending on whether or not Blue Box materials were set out. In almost every case the number of houses setting

#### TABLE 9: SUMMARY OF DATA COLLECTED AND INTENDED USE OF THE RESULTS

#### Kind of data

Weight of refuse samples collected <u>en route</u> in EAs; number of residences setting out bagged refuse and Blue Boxes

Weight of components in bagged refuse and Blue Boxes after sorting

Weight of components in bagged refuse collected from schools (East York) and single Christmas week residential collection (East York)

Weight of yard waste collected en route in EAs

Chemical analyses

#### Use of data

Calculation of per capita waste generation rates (apts. in Fergus; those < 30 units in East York)

Calculation of percent(%) composition

Calculation of Blue Box "capture rate"

Calculation of moisture content of components in the refuse

Calculation of per capita waste generation rates

Calculation of percent(%) composition

(not included as part of the present method development Study)

Inorganic analyses of vacuum cleaner bag contents

BTU values for selected materials

#### TABLE 10: SAMPLE CALCULATION OF THE PER CAPITA GENERATION RATE IN AN EA. DATA FROM THE TOWN OF FERGUS, EA # 258

Town: Fergus EA: 258 / high income; primarily single detached dwellings Pop: 600 Dwellings: 205 PPD: 2.93

out Blue Boxes did not equal the number setting out other household refuse. A two-step calculation was required to account for this difference.

Note: A decision had to be made with respect to apportioning the weight of the Blue Box materials collected at curbside. Recycling coordinators from 4 municipalities in Ontario were contacted and asked about the average frequency of Blue Box set-out by residents. Where Blue Box monitoring had been carefully conducted (e.g., East York), a complex picture emerged which reflected demographics of the municipality, thickness of the newspapers, seasonality, etc. Nevertheless, an average set-out frequency of once every two weeks seemed to be a reasonable compromise, given a range of: more than 1 set-out per week to less than 1 set-out every 3 weeks. Thus, we have employed a conservative convention whereby the weight of Blue Box items was divided by two (2) before including these materials in calculations of per capita generation rates or percent composition.

The generation rate of household waste, excluding yard waste, was calculated as follows: The weight of household refuse sampled (column 3) was divided by the number of houses the sample was taken from (column 2). The weight of Blue Box material collected (column 4) was divided by 2, as noted above, and then divided by the number of houses were Blue Box materials had been set out. Next, these two weights were added together and then divided by 7 (days per week) to give a daily weight per dwelling (column 5).

The daily per capita generation rate (column 6) was calculated by dividing the daily weight per dwelling (column 5) by the population per dwelling (PPD) for the given EA.

As an example of the calculation, consider Table 10, Sample Number 31:

 115.8 kg (household refuse) divided by 8 (dwellings) = 14.47 kg per dwelling per week; then,

- 2. 31.1 kg (Blue Box materials) divided by 2 (weeks) = 15.55 kg per week; 15.55 kg Blue Box materials per week divided by 5 (dwellings) = 3.11 kg per dwelling per week; then,
- 3. [14.47 kg/dwelling plus 3.11 kg/dwelling] divided by 7 (days per week)
  = 2.51 kg/dwelling/day;
- 2.51 kg/dwelling/day divided by 2.93 (population per dwelling) = 0.86 kg/capita/day.

The average per capita waste generation rate (kg/capita/day) of all 10 samples was determined after summing all values in Table 10 and dividing by the number of samples.

Thus the per capita waste generation for EA 258 (high income/primarily single detached dwellings) was 0.88 kg  $\pm$  a Standard Error of 0.09. In other words, the "true" estimate of the average per capita generation rate of the EA lies within the range: 0.79 to 0.97 kg/capita/day.

#### 2.2.4.3 Method to Estimate the "Capture Rate" of the Blue Box Program

The following method was used to estimate the "capture rate" of the Blue Box programs in the Town of Fergus and the Borough of East York. The total weight of Blue Box items in each sample was the sum of: (1) the weight of materials set out in Blue Boxes, divided by 2 as per the conservative convention noted above,; and (2) the weight of the same "potential" Blue Box items that were put out in the bagged refuse, rather than in Blue Boxes. The weight of material set out in the Blue Boxes (1) was divided by the sum of (1) and (2) determined above and then multiplied by 100. This gave the percent which the Blue Box materials represented of the total "municipally recyclable" and potentially collectable categories of materials in the residential waste stream.

#### 2.2.4.4 Per Capita Generation Rate of Waste From Schools

Per capita generation rates were calculated using student population, number of teachers and support staff (administrators, clerical, janitors, etc.). In calculating the per capita generation rate for schools, a 5 day week was used to account for weekend closure of the institutions.

It may also be noted that, as only a single 100 kg (approximately) sample of waste was collected and sorted from each school, an average waste composition was computed by pooling the data from all of the schools. No statistical comparison of waste generation characteristics of the 3 categories of schools may be made.

#### 2.2.5 White Goods and Bulk Item Data Collection Method

Characterization of white goods and bulk item waste generation requires a method that monitors the waste on a yearly basis, and monitors the entire municipality. The put-out rate for worn-out appliances, furniture and other bulk items can be expected to vary over the course of the year. For example, many communities may have a spring/fall clean-up at which time many tonnes of bulk items may be discarded, while for the rest of the year very few bulk items will enter the waste stream. Similarly bulk item put-out by residents will be sporadic and difficult to predict for the municipality being studied.

To determine generation rates of bulk items on a yearly basis, several communities were contacted that have kept accurate yearly records of tonnages of bulk items collected as part of their residential waste collection program. By contacting numerous communities, a broad spectrum of collection practices is represented. As well, a range of potential generation rates can be assessed.

#### 2.2.5.1 Data Collection

Data were collected by telephoning the person responsible for waste collection in each community. This person would typically be the municipal engineer or the recycling co-ordinator. Additional correspondence by telephone or letter was often required to complete the survey and data collection.

Data requested of each community included:

- 1. tonnages of white goods collected on a weekly/monthly/yearly basis;
- 2. tonnages of other bulk items collected on a weekly/monthly/yearly basis;
- 3. description of the collection program for white goods/bulk items to identify data that may be biased or incomplete.

Population data for each community for various years was determined from the Ontario Municipal Directory. These data were used to calculate the per capita generation rate (tonne/capita/year) of white goods and bulk items.

#### 2.2.5.2 Communities Reporting Data

A total of 18 communities was contacted by telephone to inquire about the availability of collection records of white goods and other bulky items. The following 10 communities were able to report collection data:

Town of Ajax Borough of East York City of Etobicoke City of Mississauga City of North York City of Oakville City of Toronto Town of Whitby County of Wellington City of York

SECTION 3

£

RESULTS

#### 3.0 <u>RESULTS</u>

#### 3.1 Estimation of Per Capita Waste Generation Rates

#### 3.1.1 Town of Fergus

Table 11 shows the per capita generation rates and the quantities of waste (kg/day) generated for the 5 EAs that were part of the sampling program. The following general equation is used:

#### OVERALL GENERATION RATE (kg/cap/day)

| Sum of cells   |   | waste       | 1 |   | EAs in the cell as         |
|----------------|---|-------------|---|---|----------------------------|
| Al-C3 in       | = | generation  |   | х | percentage of total number |
| income/housing |   | rate in a   |   |   | of EAs in the municipality |
| matrix         |   | matrix cell |   |   | (for Study purposes)       |

EAs 255, 259 and 264 were not sampled in the study. The per capita waste generation rates were estimated for these EAs from the rates determined for the EAs that were sampled within the respective income / housing matrix cell (recall Tables 4 & 6). For example, EA 259 is in cell B2. The 0.80 kg per capita generation rate is the average of the two rates obtained from data for EAs 256 and 263 in matrix cell B2.

The average per capita generation rate for the 9 EAs, i.e., 0.804 kg/capita/day, was multiplied by the 1988 population of Fergus (6,757) to get the estimate of the daily rate of residential waste generation for the whole Town (exclusive of yard waste): 5,433 kg/day or 5.43 tonnes/day. The data are shown in Appendix A. (Note that Sample 51 EA 260, is omitted from per capita waste generation rate calculations due to excessive amounts of miscellaneous wastes which indicated that this was a non-representative sample).

We have attempted to check the accuracy of the residential waste generation estimate for the Town of Fergus in the following way.

TABLE 11: RESIDENTIAL WASTE GENERATION DATA INCORPORATED INTO THE INCOME/HOUSING MATRIX TO ESTIMATE THE WEIGHTED PER CAPITA GENERATION RATE (KG/CAPITA/DAY) FOR THE TOWN OF FERGUS.

|                      | (1)<br>Primarily   | (2)                | (3)<br>Primarily      |
|----------------------|--------------------|--------------------|-----------------------|
|                      | Single<br>Detached | Mixed<br>Dwellings | Multiple<br>Dwellings |
| (A) High<br>Income   | 0.88 (11.1%)       | 0 (0%)             | 0 (0%)                |
| (B) Medium<br>Income | 0.89 (22.2%)       | 0.80 (44.4%)       | 0.60 (11.1%)          |
| (C) Low<br>Income    | 0 (0%)             | 0 (0%)             | 0.78 (11.1%)          |

Medium Income; Mixed Dwellings (B2): Average of EAs 256 & 263 Weighted per capita generation rate (kg/capita/day) = 0.804

<sup>1</sup> Sample 51 from EA 260 is omitted from the calulation of Generation rate for Low Income; Primarily Multiple Dwellings due to excessive amount of miscellaneous material

First, residential curbside collection tonnage was estimated from the total tipping charges that Plein Disposal Inc. incurred during the course of our Study in Fergus. It should be noted that this weight included commercial waste from stores located on St. Andrews Street and environs.

.

.

5,054/6 weeks  $\div$  29.70/tonne = 170.2 tonnes/6 weeks 170.2 tonnes/6 weeks  $\div$  42 days/6 weeks = 4.05 tonnes/day

- Second, waste from apartments and "condominiums" in Fergus was collected by McLellan's Disposal Services Limited. According to their records, 100 cu yd of uncompacted waste were picked up weekly form these premises. Using an estimated weight of 250 lbs/cu yd, the following tonnage may be calculated: (100 cu yd/wk x 6 wks x 250 lbs/cu yd) ÷ (2.2 lb/kg x 42 days = 1,623 kg/day or 1.6 tonnes/day
- Third, McLellan's Disposal Services Limited also estimated that they picked up 37.7 tonnes of Blue Box items over that 42 day period, or 0.90 tonnes/day.
- Fourth, the total weight of materials (including Blue box and yard waste) collected curbside over that time by the study team was 7.3 tonnes or 0.17 tonnes/day.

The TOTAL of these four separate quantities is 6.72 tonnes day. This number includes commercial waste, noted above, as well as yard waste. The Study estimate, derived from the per capita generation rate, is 5.43 tonnes/day and does not include yard waste, which is on the order of 20% of the weight of the total waste stream collected by the Study team.

The average population per dwelling in Fergus is 2.63 (Table 11). The average per capita generation rate of 0.804 kg capita/day (or 1.77 lbs/capita/day) = 5.63 kg/capita/wk (or 12.4 lbs/capita/wk). It should be reiterated that the Fergus data do not include yard wastes.

#### 3.1.2 City of North Bay

Appendix B gives the data obtained for each EA that was sampled. Table 12 reports the per capita generation rate calculated for the study enumeration areas.

The estimated average per capita generation rate of residential waste in North Bay for the medium income brackets is 0.93 kg/capita/day, exclusive of yard waste.

#### 3.1.3 Borough of East York

The income/dwelling matrix in Table 13 accounts for 95% of the EAs in the Borough of East York. Appendix C, herein, gives the data obtained for each EA that was sampled during the course of the study, including the data for the schools and the Christmas collection of refuse in EA 90-117.

Table 13 shows how the per capita generation rates calculated from the sample data are used to estimate the overall generation rate for the Borough of East York.

The estimated average per capita generation rate of residential waste in the Borough of East York was 0.99 kg/capita/day, exclusive of yard waste and leaves.

Generation rate for matrix cell A3 is the average of the cells A1 & A2 Weighted per capita generation rate (kg/capita/day) = 0.99

#### 3.2 Composition of Residential Waste Exclusive of Yard Waste

#### 3.2.1 Town of Fergus

Data for the composition of the residential waste stream in the 6 EAs is given in Appendix A1. Table 14 is the estimated average waste composition for the Town determined by weighting the means from each EA using the income housing matrix. Because we are using a series of weighted averages for each waste component, the total composition for a particular municipality will not necessarily sum to a total of 100 percent.

Figure 14 is a bar graph showing the percent food waste data,  $\pm$  1 Standard Error (SE). It will be recalled that both sample size (minimum weight = 100 kg) and sample number (9 to 10 per EA) were needed to achieve an accuracy of 90% and a precision of  $\pm$  15% for the food waste fraction only. Two sample means are different from each other if their standard errors do not overlap.

#### 3.2.2 City of North Bay

Data for the composition of the residential waste stream in the 2 middle income EAs is given in Appendix B1. Table 14 gives the estimated average waste composition for the City, based on a sample averaging of the available data. The statistically significant food waste data,  $\pm$  1 SE, are graphed in Figure 15.

#### 3.2.3 Borough of East York

Data from the composition of the residential waste stream in the 7 EAs is given in Appendix C1. Table 14 is the estimated average waste composition for the Borough, determined by weighting the means from each EA, using the income dwelling matrix.

Figure 16 is a bar graph showing the % food waste data, ± 1 SE.

| Disposable diaper                   | 10150  | 23536 |

1 BTU/lb = 2.319 kJ/kg

#### 3.8.3 Borough of East York

The raw data for yard waste are found in Appendix C2.

#### 3.9 Estimation of the "Capture Rate" of the Blue Box Programs

Estimation of the "Capture Rate" of the Blue Box programs in the Town of Fergus and the Borough of East York are Shown in Tables 20 and 21, respectively. Note that the conservative estimate of Blue Box material, as discussed in Section 2.2.4.2, was employed for the amount of material in the Blue Boxes.

#### 3.10 The Effect of Life Style On Residential Waste Characteristics

As we noted in Section 2.1, the method used in the Study was based on the hypothesis that the characteristics of a residential waste stream are related to the socioeconomic life styles of people and the demographic characteristics of a municipality. In Table 22, the per capita generation rates of total residential waste and the quantity of kitchen waste (putrescible matter) for the Town of Fergus and the Borough of East York are compared on the basis of income level and dwelling type. The East York data show that residents in detached dwellings generate more waste than those living in multiple dwellings. The data for the middle income group in the Town of Fergus also suggest this relationship. Other trends in the total waste generation data are less evident.

The generation rates of the kitchen waste (putrescible matter) tended to follow the pattern set by the per capita generation rate of total refuse, but as noted earlier, a potential sampling bias may have underestimated the Borough of East York medium and low income/multiple dwelling kitchen refuse. The uncertainty in the Borough of East York multiple residential waste composition data is not

<sup>1</sup> High-rise apartment buildings do not have Blue Box programs

present in the data from the Town of Fergus because the refuse from tenants was bagged but not compacted. The data for the middle income population in the Town of Fergus indicates a convincing trend, suggesting that more food waste is generated by the residents of detached dwellings than those living in multiple dwellings. The potential underestimation of the quantity of the components in the residential refuse from multiple dwellings in the Borough of East York, will exaggerate the difference in kitchen waste generation rates in the detached versus multiple dwelling data.

As the food waste fraction is the only fraction of the residential waste stream where there is some statistical confidence, the per capita generation of food waste by the Town of Fergus and the Borough of East York are compared in the right hand column of Table 22. EA matrix weighting factors were employed to obtain an overall estimate of the per capita generation rate of food waste in the two municipalities. It is interesting to note that the per capita generation rate of kitchen waste in the Town of Fergus, 0.23 kg/cap/day, represented 28.8% of the residential waste stream (see Table 14), while the comparable values for the Borough of East York were: 0.25 kg/cap/day and 25.5%.

#### 3.11 White Goods and Bulk Items: Estimation of Per Capita Generation Rates

Data were collected from 10 communities regarding tonnages of white goods and non-metal bulk items generated. Data for non-metal bulk items collected were available for only 4 of the 10 communities. Generation rates (tonne/capita/year) were based on population data for 1985 and 1988 as reported in the Ontario Municipal Directory.

#### 3.11.1 White Goods Generation Rate

The average generation rate for white goods (metal appliances etc.) is 0.0015 (tonne/capita/year)  $\pm 0.00018$  (data in Appendix F).

#### 3.11.2 Non-Metal Bulk Item Generation Rate

The average generation rate for other bulk items (non-metal) is 0.0172 (tonne/capita/year)  $\pm 0.0032$  (data in Appendix F).

SECTION 4

DISCUSSION

#### 4.0 DISCUSSION

#### 4.1 <u>General</u>

The methods developed in the present Study are based on the hypothesis that residential waste generation is a function of people's habits and lifestyles. Both economic status and type of housing are two factors that may influence waste generation patterns; cultural background is another. As mentioned in the **Introduction**, this working hypothesis is well supported by the data of W. Rathje and associates and their pioneering studies in the cities of Milwaukee, Wisconsin, and later, in Phoenix, Arizona (refs. 34, 35 & 36).

The scope of the present study precluded an opportunity to profile the residential waste generation characteristics of a single municipality with the depth and detail achieved by Rathje and associates. Nevertheless, the essential elements that we have presented herein are sufficient for any municipality in Ontario to use as guidelines in the development of a detailed residential waste study.

In the following paragraphs we will critically review the methods that we employed so that potential users of the procedures can have the advantage of our experience. In some cases, the need for refinement in sampling procedures will be identified; suggestions will be offered. One of the major problems that we encountered was attributed to municipal recycling programs that served residents of detached dwellings but not apartment buildings, and the sampling problems created by these practices.

#### 4.2 Income / Housing Matrix For the Three Study Municipalities

The EAs from each municipality were placed into the appropriate cells of the income/housing matrix (cf. Table 4) in Sections 2.2.1.2 to 2.2.1.6. The

procedure for determining the "absolute" numerical, or dollar, boundaries between the low, medium and high income groups was also described in Section 2.2.1.2 and Figure 3 compares the income boundaries for the three municipalities. The boundary between the low and middle income groups for the three municipalities ranged from \$27,670 to \$28,400, a narrow spread of about \$1,200. However, there was a much greater spread of about \$5,700 between the middle and high income boundaries. In other words, a large portion of the high income grouping for the Town of Fergus would be considered part of the middle income grouping for the Borough of East York. Is this an important factor to consider while evaluating the method employed in the present Study? No, it is not. The following points highlight the socio-demographic features of the approach.

- 1. Each municipal population was objectively assessed with respect to available Statistics Canada data on income and housing.
- 2. Low, middle and high income brackets are relative to individual municipalities and are based on the mean income which was calculated from Statistics Canada information on the average income within the EAs of the municipality. Other important parameters such as population age, sex, ethnic background, etc. could also be used in designing a residential waste sampling program, given time, budget and manpower to pursue a study at this level of detail.
- 3. Residential waste generation is a complex social phenomenon which cannot be quantified with the accuracy and precision that is comfortable and familiar to engineering and scientific disciplines. Nevertheless, there are acknowledged "parameters" which have been shown to be correlated with residential waste generation habits (cf. Rathje's studies, refs. 34, 35 & 36, among others). As long as municipalities take these parameters into account when they are evaluating their own, individual

population's waste generation characteristics, the appropriate waste management programs can be planned.

#### 4.3 "Verification" of the Method

Verification of the results of a scientific investigation may be carried out in a number of ways. The investigator may repeat the initial work several times, under the same conditions, in order to determine the reproducibility of the results and the reliability of the method. In order to avoid any personal bias, the work maybe carried out by others, following the procedures initially described by the original investigator. Complications arise when the phenomenon under observation/investigation undergoes periodic fluctuations, or is at least suspected of such oscillations or changes. In this case, choosing the right time to repeat the work may be a critical factor in evaluating both the results and the vorthiness of the method. Frequently, alternative procedures may be used to confer confidence or non-confidence on the method under scrutiny.

In the present Study, we have worked to develop a method to characterize and quantify a social phenomenon: residential waste generation. With respect to the amplitude in the annual cycle in waste generation, Figure 1-2 in Vesilind & Reimer (ref. 47) indicates that, for 75% of the year the weekly generation rate will be within  $\pm$  10% of the yearly average. The residential data reported by Brickner (ref. 7) supports this notion. The waste composition Studies reported herein were conducted during the summer, fall and winter; and in southwestern and in a more northerly portion of Ontario. From a theoretical point of view, if one wanted to check the accuracy of the waste data and determine the variance of the estimate, the same seasonal "windows" and geographic locations would have to be studied for several years in a row.

A municipality may choose to undertake this yearly monitoring for purposes of tracking progress in waste reduction initiatives. We (the Study) could not

undertake this task ourselves. A yearly monitoring program would have to decide whether, for example, an observed reduction in waste generation was a result of: (1) packaging laws or consumer purchasing practices (2) social changes in the community or (3) the methodology employed. However, an attempt was made to verify the Study estimates of per capita waste generation for the Town of Fergus by piecing together waste collection estimates from commercial haulers for the same time period (see Section 3.1.1).

Allowing for the uncertainties in the information assembled in the latter manner---and making some assumptions about yard waste generation---it seems that the Study method for estimating the per capita waste generation rate, exclusive of yard waste and leaves, yielded an acceptable result.

#### 4.4 Apartment Buildings: Source of Greatest Number of Problems

We have identified some of the problems that may potentially affect the estimation of both the per capita waste generation rate and the percent composition of the waste stream.

#### Per Capita Waste Generation Rate

Within a similar income grouping in the income housing matrix, the per capita waste generation rates that we determined for residents of apartment buildings were usually lower than those determined for the residents of largely detached dwellings. While we believe that the results underlie real differences in the lifestyles between residents of apartment buildings and detached dwellings [Note: anecdotal evidence of geographers supports this conclusion, although according to Dr. J. Simmons, Geography Department, University of Toronto, (pers. commun.), there is a paucity of documented observations], there is one potential source of error which could lead to a low estimate of the per capita waste generation rate.

We employed the Statistics Canada data for the average population per unit dwellings in the EAs and we have assumed that all of the inhabitants of the apartment units contributed refuse. We did not verify the assumption of 100% refuse "set out" by every apartment unit. In the case of the small apartments in the Town of Fergus and the City of North Bay, we checked the number of units occupied in each building. For the Borough of East York, we know (pers. commun., Dr. J. Simmons) that the vacancy rate of apartments (in Metro Toronto) is exceedingly low and therefore the residential population in the apartments may be accurately reflected by multiplying the number of units by the average population per unit, using Statistics Canada data for the appropriate EA.

In our Study, the weight of refuse generated by the East York apartment buildings, that were EAs unto themselves, was the sum of: 1) - the quantity of refuse removed from the refuse containers for waste composition analyses and 2) - the weight of remaining refuse in the containers. The latter weight was reported by the hauler at the time of weigh-in and disposal of the apartment's refuse at the Bermondsey Transfer Station. It is possible, but unlikely, that significant errors in the weighing resulted in the low per capita generation rates calculated for the two apartment EAs in the Borough of East York.

The most likely source of error was, therefore, the assumption that refuse was contributed from every unit. If this was not true, then we have under estimated the per capita waste generation, (i.e., the total weight of refuse should have been divided by a smaller population of waste-disposing tenants).

The composition and per capita generation rate attributed to apartment buildings may be influenced by two kinds of tenant population dynamics. First, tenant turn-over normally occurs at the end of every month, therefore the amount of waste generated by tenants coming and going will be higher than the normal waste generation rate. Second, the largest number of tenant changes occur at the end of the school year (May-June) and again at the end of August. These

are two periods when per capita generation rates in apartment buildings could be expected to exceed the normal yearly average.

#### Waste Composition: Potential Sampling Biases

The refuse generated in apartment buildings in the Town of Fergus and small apartment buildings (< 30 units) in the Borough of East York and City of North Bay was not compacted. Random samples were unbiasedly taken from accumulations of this household or "unit" refuse. In Section 2.1 we noted the lack of a Blue Box collection for apartment buildings in the Town of Fergus and the set-out of recyclable materials by some of the tenants of the small apartment buildings in the Borough of East York.

In contrast however, the household refuse was compacted in the two "apartment EAs" in the Borough of East York. We think that the combination of refuse compacting and the lack of Blue Box programs for these buildings jointly contributed to a waste sampling bias at these locations. The difficulty in removing "random" samples from the compacted bins may be attributed to: 1) an overwhelming quantity of newsprint, co-mingled with other refuse [because there was no Blue Box (waste management alternative) program in these premises]; 2) wet refuse which was generally bagged in polyethylene supermarket shopping bags. The bags were lodged (compacted with other refuse) in ways which made it difficult to remove them without tearing. When bags were torn, the contents became distributed over the refuse in a bin, making quantitative retrieval of the spilled waste very difficult. We encountered many bags that were already torn, presumably a result of the compacting process.

Thus, the 60 and 40 kg quantities of refuse that were taken for the waste composition analysis were predisposed to have a larger weight of newsprint and a lower quantity of waste contained in small polyethylene bags for a combination of reasons: 1) no alternative disposal for the newsprint was at hand for the

tenants; 2) it was easier to remove the newsprint from the compacted refuse; and 3) for detached dwellings, the weight of Blue Box materials was not included as part of refuse weight guideline of 100 kg that we collected at the curb for the waste composition study. The last factor (3) is critical and points out a weakness in the methodology. We recommend the following procedural change in order to get around the sampling bias.

The suggested procedure relates the weight of waste to be sampled with a component in the tenant's household refuse. The component must meet one criterion: it must only be collected by "regular garbage" service, with no options for diversion (i.e., Blue Box).

At the present time, we suggest that the food scrap component of household refuse makes the best "normalization" basis or guideline for this kind of sample collection. We will assume from experience that food waste represents about 27% of the household waste and it always is disposed of in the "regular garbage". For the time being we will also assume that backyard composting is not an option practised extensively by residents in apartment buildings.

We can still apply the 60 / 40 ratio to determine the relative quantities of waste to sample on days one and two, respectively. On day one, we would randomly remove sufficient refuse from the compacted waste so that the sample contained a minimum of 27% x 60, or approximately 16 kg of bagged refuse with food scraps, irrespective of the quantity of newsprint (and all other materials) that were collected during the random sampling.

The same procedure could be used on day two, except that 27% x 40, or 11 kg of bagged refuse with food scraps could have been collected as the guideline for the sample size. In this way, the two samples would have been "normalized" with respect to the general low percentage of newsprint that was found in residential "regular garbage" wherever municipal Blue Box programs were in place. Of course the weight of newsprint (and all other materials) would

be recorded as usual, but the distortion of the percent composition results would be minimized. This point is considered further in Section 4.5.

## 4.5 Percent Composition: A Useful or Confusing Concept?

Is "percent composition" a useful or a confusing concept? The report by Brickner (ref. 7) illustrates the major issue raised by the question, that is: the quantitative "illusion" created by manipulating absolute quantities of per capita generated wastes in relative terms of a percentage of an arbitrarily defined, "total" waste stream. In Table 2 of ref. 7, there are four quantities (total weights) of materials in the waste stream. Brickner shows that while the weight of a component does not change, its "percent" contribution to the total waste stream may be made to change, depending on the NUMBER of categories of components in the waste stream. The lesson from this is that waste composition data, presented as "percentage" of the total waste stream are not readily comparable if the same components are not present in the sets of data under comparison. One may attempt to adjust waste composition data by eliminating or combining categories of materials. However, if certain materials are presented in combination at the outset, e.g., a single category for both food & yard wastes, useful manipulations are precluded.

The conversion of finite quantities of a given waste to a percentage basis, particular material subjects the to a mathematical relationship of "interconnectedness" which does not exist in terms of the generation of the The sizing of waste management facilities (e.g., materials recovery waste. facilities for recyclables, centralized or backyard composting facilities, etc.) is based on the best estimates of quantities of certain waste streams that are generated in a municipality. The graphic, frequently pie-shaped depiction of waste composition data (see references cited for some of the data in Tables 1 & 2), is visually appealing but does not convey the important information that planners of waste management facilities need to know. An example of the

distortion that can result from using percentage calculations, without providing quantitative, per capita generation rates of the individual components, is illustrated in the handling of yard waste data (see also Tables 1 & 2 in Brickner; ref. 7).

A temporal component must be included as well. Yard waste production and leaf fall are seasonal events in Ontario. In some municipalities, a finite and sometimes large quantity of yard waste can be collected during spring and early summer (in some wet years; and in areas where there is no lawn and garden watering prohibition). Likewise, there is an annual leaf drop and collection in the fall in areas of municipalities where there are mature trees (not in new sub-divisions or on the grounds of many apartment complexes).

Approximately 1,100 tonnes of leaves were collected by the Borough of East York, which works out to an average of 0.01 kg of leaves cap/day---or 0.02 lbs/person/day. For municipal waste management purposes, the amortization of the tonnage of leaves and yard waste over the entire year, in order to calculate a <u>daily</u> per capita generation rate is very misleading. Leaves and yard waste are <u>not</u> generated by residents on this kind of basis. Likewise, it is equally misleading to record leaves and yard wastes as some annual percentage of an overall waste stream. A hypothetical centralized composting facility that was sized for a <u>daily</u> feed rate of leaves would be grossly undersized. In fact, the entire annual tonnage of leaves may be expected to arrive over a period of approximately 3-4 weeks. The latter arrival rate of leaves will be an important factor in formulating alternative waste management plans for their disposal. A similar argument may be made with respect to the seasonal generation of yard wastes.

In summary, residential waste generation is the result of human activities; the "necessities--and some luxuries--of life". The "residues" that remain after a single day of living can be categorized and quantified. Essential waste management practices---current and planned---require quantitative information

about the specific types of residues whose production is properly documented over "real" generation periods, i.e., day, week or month. Percentage composition <u>adds</u> nothing useful to this basic quantitative information; rather, it is a mathematical manipulation of the data that ultimately requires an explanation. Waste composition data presented in a percentage format are only useful when the physical quantity, e.g., per capita generation rate, tonnages etc., of at least one component of the waste stream is also indicated.

## 4.6 <u>The Blue Box: A Waste Management Option That Presents Problems</u> In Waste Composition Data Handling

The presence of the Blue Box "option" for setting out certain recyclable portions of residentially generated refuse at the curb has presented some significant problems for this study in two areas: 1) the general calculation of per capita generation rates for sectors of municipal populations which have a Blue Box program; 2) the estimation of the efficiency of Blue Box programs to "capture" those recyclables that are part of a municipal program and 3) the general residential waste sampling problems encountered in apartment buildings (discussed above in Section 4.3).

As noted in Section 2.2.4.2, a number of municipal recycling coordinators were interviewed in order to determine a reasonable estimate of the frequency with which residents of detached dwellings put out their Blue Boxes. While many sources of variations in frequency were noted, an overall impression was that a bi-weekly set-out frequency was not unreasonable as an average estimate. Given this assumption, how were the weights of the Blue Box materials to be calculated into the estimated average per capita generation rates and waste composition? We have reasoned that a conservative estimate is preferred and have therefore divided the weights of the Blue Box set-out by any individual and tries to provide an allowance for an "error factor", necessitated by the small sample of residents. That is, the Study Team typically collected bagged refuse

from 7-10 dwellings with Blue Boxes coming from a varied proportion of these dwellings. If our sample population were on the order of 100 or more dwellings, then, given an average bi-weekly set-out frequency, one would anticipate that approximately 50% of the dwellings would have placed there Blue Boxes at the curb each week. Therefore the weekly quantity of Blue Box materials, set out by 50% of the population, would be a reasonable estimate of the <u>weekly</u> generation rate by the entire 100 or more dwellings. In the case of our small samples, we felt it was better to err on the low, or conservative side, and divide the weight by two.

## 4.7 <u>Random Sampling---When To Exclude Large Objects From the Sample</u> <u>Collection</u>

The statistical concept of "optimum allocation in cluster analysis" is relevant to the practical problem which field crews face in a sampling program like ours. For example, an old oil burner unit was set out at curbside, along with bagged waste. The question arose as to whether to include this item as part of our 100 kg sample or whether to record the weight of this item and treat it separately, like yard waste.

The answer is based on empirical experience with respect to the standard deviation of the expected average weight (or percent composition) of the metal fraction in the residential waste stream. We know from literature reports that metal is a relatively minor component in household garbage; the average weight of metal would also have an associated standard deviation. Discarded oil burners are not a commonly encountered component in residential curbside waste and its weight does not fall within the standard deviation of the average weights of metal that have been historically encountered.

Because we are only collecting 100 kg quantities (approximately) of curbside waste, inclusion of the oil burner weight would have the secondary effect of reducing the relative (proportional) weight of other components that we would

collect to achieve the 100 kg total. (NOTE: this is similar to the problem encountered with large quantities of newsprint in the apartment building EAs in the Borough of East York where there are no Blue Box programs and also relates to the discussion of yard wastes.) Calculation of the percent composition for this sample would reveal a skew toward lower than average values for items normally encountered at a higher percent in the residential waste stream.

The optimal allocation for sample weights within clusters (ref. 19) is as follows:

The inclusion of a large oil burner causes the fraction for miscellaneous metal to upset the optimal allocation function. The only solutions to this problem are to increase the sum of  $[N_1...N_k]$  (i.e. total sample weight), or to omit the large item, <u>a priori</u>, from the sample.

### 4.8 Determining the Number of Samples to Collect

## 4.8.1 The Original Klee & Carruth (1970) Working Definition of "Organics": Perpetuation of Half the Story Can be Misleading

For the record, it is important to note that certain details in the important work of Klee & Carruth (ref. 25) came to light in the later report of Woodyard & Klee (ref. 48). The latter paper came to our attention after our Study was well underway and shows a graph depicting the range of numbers of 200 - 300 lb.(90-136 kg.) samples that must be analyzed with respect to the relative composition of particular constituents in the waste stream. Graphs of these relationships have appeared in the published literature (ref. 47, Figure 1-6; Figure 1 herein) and in an unpublished manuscript, courtesy of Mr. A. Geswein, U.S.E.P.A. (pers. commun.).

More important is the terminology that was employed by Woodyard and Klee (ref. 48) in the classification of the components in the waste stream. The following five categories were used:

```
organics (wet garbage, yard waste, mixed paper, plastic and
rubber);
metal (ferrous, aluminum and/or other nonferrous);
glass (mixed or colour sorted);
newsprint
corrugated
```

Of interest is the wide variety of items under the category of "organics". While Klee and coworkers were chemically correct in their assignments to this category, the present "conventions" generally separate these items into individual categories (perhaps with the exclusion of wet garbage and yard wastes which are frequently combined; see Table 1, herein). By combining as many materials as they did under the heading of "organics" the relative weight of this fraction of the waste stream was greatly increased, vis-à-vis a conservative definition that restricts "organics" to just kitchen or food wastes. The implications for the original Woodyard & Klee category is that fewer 200 - 300 lb.(90-136 kg.) samples were needed in order to achieve a precision of  $\pm$  10%, than presently would be needed for an "organic" category with only food wastes in it, as in our Study. The broader definition of organics used by Klee and coworkers would have application if waste composition information was to be evaluated with respect to the incineration of waste streams.

At the outset of the Study, we were unaware of the Woodyard and Klee paper and <u>assumed</u>--incorrectly--that the term organics, shown on the graphs noted

above was restricted to the more conventional usage of present day. Hence, our curb-side sampling plan called for 9 - 10 samples of 90 - 136 kg each in order to give a precision with respect to the organic fraction (by our definition) of  $\pm$  10%.

#### Estimated Percent Composition: Kitchen Waste

The number of samples taken in the study for the purposes of estimating percent composition of household waste was based on the results reported by Klee & Carruth (ref. 25). It is possible, however, to determine the number of samples required to estimate the percent composition of waste within a stated confidence level for the population under study. These calculations are carried out in exactly the same manner as the calculations to estimate the required sample size for the estimation of per capita generation rate (see section 4.8.2 below).

Using the Borough of East York as an example, the following calculation can be made to determine the number of EAs that must be sampled to achieve the desired estimate of the percent composition of kitchen waste. In this case, percent composition will be estimated at a precision of  $\pm$  15%, with a 90% probability (confidence level).

The following statistical relationships apply:

$$n = (ts/d)^2$$

where:

n = number of required samples

- t = t-value at the required confidence level, with appropriate degrees of freedom
- s = estimation of the population standard deviation
- d = precision requirement for the estimate of the population parameter

For example in East York the following calculation can be made:

The t-value at n = 18, (t = 1.740, d.f. = 17), is less than n = 7 (t = 1.943), therefore, a better approximation of the required sample size can be calculated.

By reiteration of the above steps for n = 18, and n = 14, the new approximation of the required sample size is n = 14.7. A final calculation finds:

n = 15 t = 1.761 d.f. = 14 n =  $((1.761 \times 5.194) / (24.0 \times 0.1))^2$ n = 14.5

confirming the approximation.

In the case of the Borough of East York, 8 additional EAs would be required for sampling to achieve the accuracy desired for the food waste component. These EAs could be selected randomly from the list of all possible EAs, or they could be apportioned over all the matrix cells.

In the Town of Fergus, the number of EAs required for sampling to achieve the stated accuracy is only 5 (calculations not shown). This indicates that the number of samples actually taken (6) was more than enough to achieve an estimate at the stated accuracy. No calculations were attempted for the City of North Bay due to the limited nature of the data.

## 4.8.2 Determining the Appropriate Number of EAs to Sample For the Accuracy of Percentage Waste Generation Rates Required

The following points may be noted about the method:

- 1. Each EA selected for study was chosen at random by Decima Research, based on Statistics Canada information, as described in Section 2.2.1. In the case of the Borough of East York, if the EA turned out to have too small a population for us to sample, Decima rejected the EA and randomly chose another. If the EA turned out to present sampling problems because the dwellings were mostly located over store-fronts, we reported this to Decima and they randomly chose a replacement. As noted earlier in the report, waste generated in apartment units over stores was co-mingled with waste from the stores. These locations are not easily included in a residential waste sampling program.
- 2. In the Borough of East York, where there was such a large number of EAs in each income/dwelling matrix cell, it would have been desirable to sample more than one EA per cell---time, manpower and budget permitting. Using the standard deviation of the average per capita generation rates computed for all 7 EAs, we can calculate the number of EAs that we may theoretically wish to sample in the Borough of East York if we wanted to obtain an accuracy of ± 10% with a 90% confidence level for the estimate of the average per capita generation rate.

The following relationships apply:  $n = (ts/d)^2$ 

where:

| n = |                                               |
|-----|-----------------------------------------------|
| t = | t-value at required confidence level, with    |
|     | appropriate degrees of freedom                |
| s = | estimate of the population standard deviation |
| d = | precision requirement for estimate of         |
|     | population parameter                          |

From our sample of 7 EAs, the following results were obtained:

(unweighted sample mean)  $\tilde{x} = 1.039 \text{ (kg/cap/day)}$ (unweighted standard deviation) s = 0.188(for 90% confidence level) alpha = 0.1alpha/2 = 0.05(two-tail test of confidence) degrees of freedom = (n-1) = 6= 1.943 t-value  $n = ((1.943 \times 0.188) / (1.03 \times 0.1))^2$ n = 12.6The t-value at n = 13 (t = 1.782; d.f. = 12) is much less than at n = 7 (t = 1.943), therefore a better approximation of the required sample size can be calculated. By reiteration of the above steps for n = 13, the new approximation of the required sample size is n = 11. A final calculation finds: n = 11 t = 1.812 $d_{1}f_{1} = 10$  $n = ((1.812 \times 0.188) / (1.03 \times 0.1))^2$ n = 10.9

confirming the approximation.

In the Borough of East York, only 3 additional EAs would be required to achieve the accuracy sought. These EAs could be randomly selected from the list of all possible EAs, or they could be selected from the matrix cells with the largest number of EAs.

In the Town of Fergus, the number of EAs required for sampling to achieve the stated accuracy is 17 (calculations not shown). This large number poses a problem as there are not 17 EAs in Fergus. One suggestion would be to resample EAs at regular intervals until the required number of EAs have been sampled.

No calculations were attempted for North Bay due to the limited nature of the data.

## 4.9 White Goods: General Comments On Generation Rates Reported

Generation rates for both white goods and non-metal bulk items varies substantially from community to community and from year to year. This can be attributed to a variety of reasons, several of which were identified in our discussions with the community officials. Notable causes for differences are:

- 1. Type of collection service. Some communities collect white goods and bulk items year round, while other communities have only a spring/fall bulk collection.
- 2. Commitment to recycling. Communities promoting recycling of white goods for scrap metal (e.g. Toronto) reported increases in tonnages collected as the recycling program became more established.
- 3. Definition of a "bulky" item requiring special collection. Depending on the municipal waste collection policy, some items that are treated as bulk or special pick-up items in one community may be collected with regular curbside waste in communities that have a "take all" collection policy.

**SECTION 5** 

CONCLUSIONS AND RECOMMENDATIONS

.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

## 5.1 General

The Study methodology may be used by individual municipalities wishing to assess their own residential waste streams. It may be helpful for a municipality to retain professional expertise to assist in the assessment of the Statistics Canada information on income, dwelling type and any other socio-economic parameters that the municipality has the time and budget to incorporate into their residential waste sampling program. The actual collection and sorting of residential waste can be carried out by municipal employees who have received the proper instruction on waste classification and other field techniques.

## 5.2 <u>Conclusions</u>

The results of the residential waste study presented herein lead to the following conclusions.

1) Municipalities in Ontario are implementing a number of waste diversion options for residents -- notably, Blue Box and backyard composting -- as the waste management strategies of municipalities continue to change. As the number of waste diversion options increase, the chances of obtaining an accurate baseline of waste generation data decreases. Where there was formerly a single waste stream coming from residences on a predictable and scheduled basis, now there may be two or more curbside waste streams, and possibly a another stream directed to a backyard composter. Therefore, there is more potential for error in waste composition studies conducted in municipalities that are aggressively pursuing waste diversion programs (e.g. Fergus and East York) than in those that have yet to implement such programs --- and where there is still a single residential waste stream.

- 2) Given an understanding of the <u>reality</u> of residential waste stream partitioning noted above, the residential waste assessment procedures for detached dwellings included an estimated allocation for Blue Box materials. Waste assessment of residential populations residing in multi-unit dwellings (apartments) presented additional challenges in data collection. Per capita waste generation rates were obtained for both residential groups; however, a need for improvement in sampling procedures was identified for large apartment buildings (East York) where refuse was compacted.
- 3) The per capita waste generation rates (excluding yard wastes and bulky items) for the three municipalities appeared to vary with population: Fergus 0.80 kg/capita/day; North Bay 0.93 kg/capita/day; East York 0.99 kg/capita/day. However, municipal population is probably only a superficial correlate and not causally related to the waste generation process. For example, the weight (kg) of the newspapers collected in East York, versus Fergus, may partially explain the higher per capita generation rate (kg/person/day) in East York (Table 14). Some of the difference may also be attributed to seasonal factors.
- 4) The method used in the Study has revealed apparent differences in the per capita waste generation rates within income groups. More waste (excluding yard waste and bulky waste) appears to be generated by residents of detached dwellings than by apartment dwellers (Table 22). However, no easily discernable pattern could be detected in the per capita generation rates between different income groups. More detailed sampling in each municipality would be needed to determine any potential income effects on waste generation characteristics.
- 5) It is interesting to note that there is very little difference in average per capita generation rates of kitchen waste for Fergus, North Bay and East York. The respective values are: 0.23, 0.24 and 0.25 kg/capita.day (Table 22).

When the kitchen waste fractions were computed as a percent of the total

composition of the residential waste stream, Fergus showed a higher percentage than East York and North Bay: Fergus 28.8 % versus, East York 25.5 % and North Bay 26.0 %. Again, larger quantities of other components in the East York and North Bay residential waste streams (e.g. newspapers) may explain the lower percentage (or relative proportion) of kitchen waste in the refuse.

- 6) Reliance on "waste composition percent" as the sole means of characterizing waste can be misleading and create more questions than are actually answered. The per capita generation rates of the total waste stream and its components are more important for planners of municipal waste management programs.
- 7) The study demonstrates a cost effective residential waste assessment method that uses readily available equipment and that can be implemented by municipal staff.

## 5.3 <u>RECOMMENDATIONS</u>

Municipalities conducting waste composition study might consider the following recommendations when designing the sampling protocol and implementing the study methodology.

1) For sampling and sorting convenience, municipalities may choose to conduct the waste composition studies in late spring or mid fall when refuse odours are less intense and maggots are less frequently encountered. According to Vesilind & Rimer (ref. 47), the average residential waste composition does not vary by more than ± 10% over three quarters of the year. Therefore, aesthetics of the working conditions can be taken into account without risk of obtaining skewed data. The inclusion of yard waste in overall residential waste composition percent profiles should be avoided so that baseline composition percentages are not misrepresented.

- 2) Municipalities may choose to set up independent collection systems to study the seasonal generation of yard waste and leaves. This would require a coordinated effort between garbage collection personnel, private horticultural firms and other agencies generating/and collecting these waste streams.
- 3) In order to avoid the sampling problems that we encountered with the large apartment buildings in East York, where apparent sampling biases were difficult to avoid, arrangements could be made, for example, with 30 units within the building to participate in a refuse study. This would give a more accurate appraisal of the waste composition in these large apartment buildings. As a check, the method described herein for obtaining the per capita generation rate for the entire building could then be compared with the per capita generation rate for the 30 units.
- 4) Municipalities in Ontario should follow the waste composition procedure in conducting their own waste composition analysis, for reasons of consistent data generation using a cost effective approach. Periodically, municipalities should conduct additional waste composition studies to monitor trends in residential waste management and the effectiveness of waste management programs.

ACKNOWLEDGEMENTS

#### ACKNOWLEDGEMENTS

There were many people who contributed to this research project and they are acknowledged, hopefully without omission.

Town of Fergus:

The Study crew of Bruno D'Addario, Cila Dadd, Jasmine Essue, Don Tooley and Andrea O'Malley were committed to the task of breaking new ground as the Study unfolded, working the bugs out of the Study methods and labouring under environmental conditions and logistical distances that were trying. They performed admirably.

Mr. George Woods, Clerk-Treasurer, Town of Fergus, and Mr. Don Taylor (Wellington Recycling Group) gave their support to our study in the Town of Fergus. Mr. Adolph Plein (Plein Disposal) and Mr. Peter Armer (McLellan Disposal) were patient and went out of their way to accommodate the Study team's presence in the Town of Fergus. Their cooperation was greatly appreciated.

The staff in the Engineering Department, City of Guelph, particularly, Messrs. Dan Hoornweg and John Bull, smoothly arranged for the landfill site to be our base of operations. The staff at the landfill site were ready with assistance and witty rejoinders, making the task a bit lighter.

Mr. Robert Ferguson, Commissioner of Works, Metro Toronto, gave permission to use the laboratory in the former Ontario Centre for Resource Recovery (OCRR) for the moisture analyses. Mr. Brad Guglietti, Waste Management Branch, MOE, arranged for the loan of a Sartorious balance for this work.

i

Borough of East York:

The transition of the year from fall to winter saw three new faces; the Study team was: Jasmine Essue (from Fergus), Rob Flindall, Gord McLaren and Cria Pettingill. They were steadfast and dedicated to fine tuning the procedures that were initiated by the Fergus crew.

The friendly cooperation of the East York Works Department, in particular: Messrs. Paul Cockburn, Jeff Walker, Elliot Hill, Al Karns and Ms. Kathy Killinger, facilitated the curbside collection of residential and school wastes.

Mr. Robert Ferguson, Commissioner of Works, Metro Toronto, gave us permission to sort the East York refuse on the tipping floor of the Commissioners Street Incinerator and to continue using the OCRR for the moisture analyses.

A & M Disposal and Industrial Disposal provided important refuse collection services in this phase of the Study.

City of North Bay:

Rob Flindall, Gord MacLaren and Dean Wilde (City employee) braved the elements to continue the refuse collecting and sorting in this last phase of the residential Study.

Friendly cooperation was demonstrated by the City of North Bay Engineering Department, in particular, Mr. John Simmonds. The City provided vehicles, the sorting tent and the propane heaters.

In addition to those noted above for the three municipalities, we gratefully acknowledge support and cooperation provided by Messrs. Neal Ahlberg,

## 3.3 Christmas Collection

The residential refuse from a middle income/detached dwelling from the Borough of East York (EA 90-117) was sampled during Christmas week. The data are shown in Appendix C. As Blue Boxes were not set out on the day of the Christmas collection, the quantities of these materials, generated along with the other refuse, are not known. On a per capita basis the amount of food wastes and boxboard was greater during this period than during the period of, 28-30 November, when the EA was sampled as part of the Borough of East York baseline study. When Blue Box materials are removed from the percent waste composition calculations of the November data for the same EA, the Standard Errors for the November and Christmas food waste data come close to overlapping but in fact, do not.

# 3.4 <u>Schools in East York: Per Capita Generation Rates and Waste</u> Composition

Table 15 compares the per capita generation rates of 4 primary schools, 2 junior high schools and a single senior high school in East York.

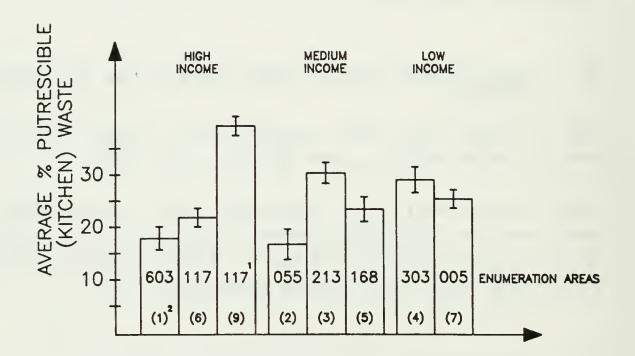

Waste composition data are given in Appendix C2. Table 15 shows that food waste ranges from 19.6% to 44.2%, with an average of 32.9%. Waste paper (total of all categories) was the greatest fraction of the waste stream and ranged from 41.2% to 64.8% of total waste, with an average of 51%.

## 3.5 Moisture Content

Table 16 shows the moisture content of combustible materials in the residential waste from both the Borough of East York and the Town of Fergus.

# 3.6 <u>Metal Analyses On Vacuum Cleaner Bag Contents: Town of Fergus</u> and Borough of East York

Tables 17 and 18 gives the metal analyses conducted on the contents of vacuum cleaner bags recovered from residential waste in the Town of Fergus and the Borough of East York.

#### 3.7 BTU Values for Mixed Plastics and Disposable Diapers

Table 19 gives BTU values for 3 kinds of mixed plastic packaging: rigid and flexible wrap as well as a new (unused) disposable diaper. These data supplement the BTU information from Vesilind & Rimer (ref. 47) and Edgecombe (pers. commun.) presented in Appendix E of this report.

## 3.8 Yard Wastes

#### 3.8.1 Town of Fergus

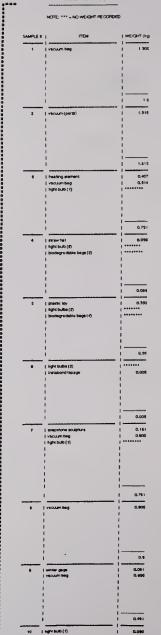

Yard waste was always collected when it was placed out with the other waste. It was weighed as a separate component of the waste stream. The raw data for yard waste are found in Appendix A2. As noted above, yard waste was not supposed to be placed at the curb for municipal collection in the Town of Fergus.

## 3.8.2 City of North Bay

The North Bay waste analysis was conducted during the month of February, so very little yard waste was expected to be found. However, several bags of yard waste, weighing 23.5 kg, were found in sample 203 for EA 104. No other samples contained yard waste.

Detached Samples 181-187 Other Dwellings Samples 188,189

> \*Collected weights do not match sample weights of sorted refuse because field crew did not have scale with them during collection. Samples were reweighed at sorting site, and excess materials (+ 100 kg) were discarded.

\*Samples 158, 159 used total weight of waste found at the apartment \*Number of days between collection days was six (6) weeks due to the City rescheduling collections over the Christmas Holiday. \*No Blue Box collection over Christmas Holiday
